Technical Support

Technical Support maintains support centers globally. All support services will be delivered in accordance with your support agreement and the then-current enterprise technical support policies. For information about our support offerings and how to contact Technical Support, visit our website:

https://www.veritas.com/support

You can manage your Veritas account information at the following URL:

https://my.veritas.com

If you have questions regarding an existing support agreement, please email the support agreement administration team for your region as follows:

Worldwide (except Japan) CustomerCare@veritas.com
Japan CustomerCare_Japan@veritas.com

Documentation

The latest documentation is available on the Veritas website:

https://sort.veritas.com/documents

Documentation feedback

Your feedback is important to us. Suggest improvements or report errors or omissions to the documentation. Include the document title, document version, chapter title, and section title of the text on which you are reporting. Send feedback to:

NB.docs@veritas.com

You can also see documentation information or ask a question on the Veritas community site:

http://www.veritas.com/community/

Veritas Services and Operations Readiness Tools (SORT)

Veritas Services and Operations Readiness Tools (SORT) is a website that provides information and tools to automate and simplify certain time-consuming administrative tasks. Depending on the product, SORT helps you prepare for installations and upgrades, identify risks in your datacenters, and improve operational efficiency. To see what services and tools SORT provides for your product, see the data sheet:

About NetBackup Cloud storage

This chapter includes the following topics:

- New cloud features in NetBackup 7.7.3
- About cloud storage features and functionality
- About the catalog backup of cloud configuration files
- About support limitations for NetBackup cloud storage

New cloud features in NetBackup 7.7.3

Beginning with this NetBackup release, you can compress your backup data before you send it to cloud storage server. You can enable data compression on the NetBackup media server while you configure your cloud storage server.

See “About data compression for cloud backups” on page 42.

Note: The compression option is available only for Amazon S3-compatible cloud providers.

About cloud storage features and functionality

NetBackup Cloud Storage enables you to back up and restore data from cloud Storage as a Service (STaaS) vendors. NetBackup Cloud Storage is integrated with Veritas OpenStorage.

Table 1-1 outlines the features and functionality NetBackup Cloud Storage delivers.
### Table 1-1 Features and functionality

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Configuration Wizard</strong></td>
<td>A <strong>Cloud Storage Server Configuration</strong> wizard is incorporated to facilitate the cloud storage setup and storage provisioning. Cloud storage provisioning now happens entirely through the NetBackup interface.</td>
</tr>
<tr>
<td><strong>Compression</strong></td>
<td>NetBackup Cloud Storage Compression compresses the data inline before it is sent to the cloud. The compression feature uses a third-party library called LZO Pro (with compression level 3).</td>
</tr>
<tr>
<td><strong>Encryption</strong></td>
<td>NetBackup Cloud Storage Encryption encrypts the data inline before it is sent to the cloud. Encryption interfaces with the NetBackup Key Management Service (KMS) to leverage its ability to manage encryption keys. The encryption feature uses an AES 256 cipher feedback (CFB) mode encryption.</td>
</tr>
</tbody>
</table>
| **Throttling**  | NetBackup Cloud Storage throttling controls the data transfer rates between your network and the cloud. The throttling values are set on a per NetBackup media server basis. In certain implementations, you want to limit WAN usage for backups and restores to the cloud. You want to implement this limit so you do not constrain other network activity. Throttling provides a mechanism to the NetBackup administrators to limit NetBackup Cloud Storage traffic. By implementing a limit to cloud WAN traffic, it cannot consume more than the allocated bandwidth. NetBackup Cloud Storage Throttling lets you configure and control the following:  
  - Different bandwidth value for both read and write operations.
  - The maximum number of connections that are supported for each cloud provider at any given time.
  - Network bandwidth as a percent of total bandwidth.
  - Network bandwidth per block of time. |
Table 1-1  Features and functionality (continued)

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
</table>
| Metering         | The NetBackup Cloud Storage metering reports enable you to monitor data transfers within NetBackup Cloud Storage.  
Cloud-based storage is unlike traditional tape or disk media, which use persistent backup images. Your cloud storage vendor calculates cloud-based storage costs per byte stored and per byte transferred.  
The NetBackup Cloud Storage software uses several techniques to minimize stored and transferred data. With these techniques, traditional catalog-based information about the amount of protected data no longer equates to the amount of data that is stored or transferred. Metering allows installations to monitor the amount of data that is transferred on a per media server basis across one or more cloud-based storage providers.  
Metering reports are generated through NetBackup OpsCenter. |
| Cloud Storage service | The NetBackup CloudStore Service Container (nbcssc) process performs the following functions:  
■ Controls the configuration parameters that are related to NetBackup Cloud Storage  
■ Generates the metering information for the metering plug-in  
■ Controls the network bandwidth usage with the help of the throttling plug-in  
On Windows, it is a standard service installed by NetBackup. On UNIX, it runs as a standard daemon. |
| Storage providers | Veritas currently supports several cloud storage providers. More information is available about each of these vendors.  
See "About the cloud storage providers" on page 13. |
Table 1-1  Features and functionality (continued)

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpsCenter Reporting</td>
<td>Monitoring and reporting of the data that is sent to cloud storage is available through new cloud reports in OpsCenter. The cloud reports include:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Job Success Rate</strong>: Success rate by backup job level across domains, clients, policies, and business level views filtered on cloud-based storage.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Data Expiring In Future</strong>: Data that expires each day for the next 7 days filtered on cloud-based storage.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Cloud Metering</strong>: Historical view of the data that is written to cloud per cloud provider.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Average Data Transfer Rate</strong>: Historical view of average data transfer rate to cloud per cloud provider.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Cloud Metering Chargeback</strong>: Ranking, forecast, and distribution view of the cost that is incurred on cloud-based storage per cloud provider.</td>
</tr>
</tbody>
</table>

*Note:* OpsCenter supports monitoring and reporting of the following cloud providers: Amazon S3, AT&T, and Rackspace.

Among all Amazon S3-compatible cloud providers that NetBackup supports, OpsCenter supports monitoring and reporting of Amazon S3 only.

---

**About the catalog backup of cloud configuration files**

The following cloud configuration files are backed up during the NetBackup catalog backup process:

- All `.txt` files in the `meter` directory, which contain intermediate metering data
- `CloudInstance.xml`
- `CloudProvider.xml`
- `cloudstore.conf`
- `libstśniencrypt.conf`
- `libstspimetering.conf`
- `libstspithrottling.conf`
- `libstspicloud_provider_name.conf`
  - All `.conf` files that are specific to the cloud providers that NetBackup supports
- `libstspicloud_provider_name.pref`
  - All `.pref` files that are specific to the cloud providers that NetBackup supports
The cloud configuration files that are backed up during the catalog backup process reside at the following location:

Windows  

install_path\NetBackup\db\cloud

UNIX  

usr/openv/netbackup/db/cloud

**Note:** The `cacert.pem` file is not backed up during the NetBackup catalog backup process.

---

**About support limitations for NetBackup cloud storage**

The following items are some of the limitations of NetBackup cloud storage:

- The cloud vendors do not support optimized duplication.
- The cloud vendors do not support direct to tape (by NDMP).
- The cloud vendors do not support disk volume spanning of backup images.
- If the NetBackup master server is installed on a platform that NetBackup cloud does not support, you may observe issues in cloud storage server configuration. For the operating systems that NetBackup supports for cloud storage, see the NetBackup operating system compatibility list available through the following URL:  
- For Hitachi cloud storage, synthetic backups are not successful if you enabled the encryption option. To run the synthetic backups successfully, you need to enable the versioning option for buckets (or namespaces) through the Hitachi cloud portal. For more details on how to enable the versioning option, contact your Hitachi cloud provider.
- Cloud storage servers cannot use the same volume (or bucket) to store data. You should create a separate volume (or bucket) for each cloud storage server.
- NetBackup 7.7.1 and later versions support configuring cloud storage using the Frankfurt region.
About the cloud storage providers

This chapter includes the following topics:

- About the cloud storage providers
- About the Amazon cloud storage requirements
- About Amazon S3 storage classes
- About the Amazon GovCloud storage requirements
- About AT&T Synaptic cloud storage requirements
- About the Cloudian HyperStore storage requirements
- About the Google Nearline cloud storage requirements
- About the Hitachi cloud storage requirements
- About Rackspace Cloud Files storage requirements
- About the Verizon cloud storage requirements
- About private clouds from Amazon S3-compatible cloud providers

About the cloud storage providers

The information that is required to configure cloud storage in NetBackup varies according to each cloud storage provider's requirements. See Table 2-1 for links to the topics that describe the requirements for each provider.
### Table 2-1  Cloud storage providers for NetBackup

<table>
<thead>
<tr>
<th>Cloud storage provider</th>
<th>Topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>See “About the Amazon cloud storage requirements” on page 14.</td>
</tr>
<tr>
<td>Amazon GovCloud</td>
<td>See “About the Amazon GovCloud storage requirements” on page 16.</td>
</tr>
<tr>
<td>AT&amp;T</td>
<td>See “About AT&amp;T Synaptic cloud storage requirements” on page 17.</td>
</tr>
<tr>
<td>Cloudian</td>
<td>See “About the Cloudian HyperStore storage requirements” on page 20.</td>
</tr>
<tr>
<td>Google Nearline</td>
<td>See “About the Google Nearline cloud storage requirements” on page 20.</td>

<tr>
<td>Rackspace</td>
<td>See “About Rackspace Cloud Files storage requirements” on page 22.</td>
</tr>
<tr>
<td>Verizon</td>
<td>See “About the Verizon cloud storage requirements” on page 24.</td>
</tr>
</tbody>
</table>

NetBackup also may support private clouds from the vendors that provide a private cloud option.

See “About private clouds from Amazon S3-compatible cloud providers” on page 25.

See “About private clouds from AT&T” on page 18.

See “About private clouds from Rackspace” on page 23.

See “About Amazon S3 storage classes” on page 16.

---

**About the Amazon cloud storage requirements**

NetBackup Cloud Storage enables Veritas NetBackup to backup data to and restore data from Amazon Simple Storage Service (S3).

**Table 2-2** describes the details and requirements of Amazon cloud storage in NetBackup.

Cloud storage providers other than Amazon also use the Amazon S3 protocol for their storage.
Table 2-2 Amazon cloud storage requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>License requirement</td>
<td>You must have a NetBackup Data Protection Optimization Option license key.</td>
</tr>
<tr>
<td>Amazon account requirements</td>
<td>You must obtain an Amazon Simple Storage Service (S3) account and the associated user name and password. You also must obtain an Amazon access ID and secure access token.</td>
</tr>
<tr>
<td>Buckets</td>
<td>The following are the requirements for the Amazon storage buckets:</td>
</tr>
<tr>
<td></td>
<td>■ You can create a maximum of 100 buckets per Amazon account.</td>
</tr>
<tr>
<td></td>
<td>■ You can delete empty buckets using the Amazon AWS Management Console. However, you may not be able to reuse the names of the deleted buckets while creating buckets in NetBackup.</td>
</tr>
<tr>
<td></td>
<td>■ You can create buckets in any Amazon storage region that NetBackup supports.</td>
</tr>
<tr>
<td>Bucket names</td>
<td>Veritas recommends that you use NetBackup to create the buckets that you use with NetBackup. The Amazon S3 interface may allow the characters that NetBackup does not allow. Consequently, by using NetBackup to create the buckets you can limit the potential problems.</td>
</tr>
<tr>
<td></td>
<td>The following are the NetBackup requirements for bucket names:</td>
</tr>
<tr>
<td></td>
<td>■ Bucket names must be at least 3 and no more than 63 characters long.</td>
</tr>
<tr>
<td></td>
<td>■ Bucket names can contain lowercase letters, numbers, and dashes.</td>
</tr>
<tr>
<td>Number of disk pools</td>
<td>You can create a maximum of 90 disk pools. Attemps to create more than 90 disk pools generate a “failed to create disk volume, invalid request” error message.</td>
</tr>
</tbody>
</table>

NetBackup supports the private clouds from the supported cloud providers.

See “About private clouds from Amazon S3-compatible cloud providers” on page 25.

See “About Amazon S3 storage classes” on page 16.

More information about Amazon S3 is available from Amazon.

http://aws.amazon.com/s3/

See “About the cloud storage providers” on page 13.
About Amazon S3 storage classes

NetBackup supports Amazon S3 storage classes. While you configure an Amazon S3 cloud storage, you can select a specific storage class that you want to assign to your objects or data backups. The objects are stored according to their storage classes.

NetBackup supports the following Amazon S3 storage classes: STANDARD or STANDARD_IA

IA stands for Infrequent Access.

In the following scenarios, NetBackup assigns the default STANDARD storage class to the backups or objects:

- If you do not select a specific storage class while you configure the Amazon S3 cloud storage
- If the backups were configured in an earlier NetBackup version

See “Assigning a storage class to cloud storage” on page 72.

About the Amazon GovCloud storage requirements

NetBackup Cloud Storage enables NetBackup to backup data to and restore data from Amazon GovCloud (US).

Table 2-3 describes the details and requirements of Amazon GovCloud (US) in NetBackup.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>License requirement</td>
<td>You must have a NetBackup Data Protection Optimization Option license key.</td>
</tr>
<tr>
<td>Amazon GovCloud (US) account requirements</td>
<td>You must obtain an Amazon GovCloud account and the associated user name and password. You also must obtain an Amazon GovCloud access ID and secure access token.</td>
</tr>
</tbody>
</table>
Table 2-3  Amazon GovCloud (US) requirements (continued)

<table>

<td></td>
<td>The following are the NetBackup requirements for bucket names:</td>
</tr>
<tr>
<td></td>
<td>■ Bucket names must be at least 3 and no more than 63 characters long.</td>
</tr>
<tr>
<td></td>
<td>■ Bucket names can contain lowercase letters, numbers, and dashes (or hyphens).</td>
</tr>
<tr>
<td>Number of disk pools</td>
<td>You can create a maximum of 90 disk pools. Attempts to create more than 90 disk pools generate a “failed to create disk volume, invalid request” error message.</td>
</tr>
</tbody>
</table>

About AT&T Synaptic cloud storage requirements

NetBackup Cloud Storage enables Veritas NetBackup to backup data to and restore data from AT&T Synaptic™.

Table 2-4 describes the details and requirements of AT&T Synaptic.

Table 2-4  AT&T Synaptic requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>User account</td>
<td>An AT&amp;T Synaptic user ID and password are required to create the storage server.</td>

</table>
Table 2-4: AT&T Synaptic requirements (continued)

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage requirements</td>
<td>The following are the requirements for AT&amp;T cloud storage:</td>
</tr>
<tr>
<td></td>
<td>■ You must have a NetBackup Data Protection Optimization Option license key.</td>
</tr>
<tr>
<td></td>
<td>■ You must use NetBackup to create the volume for your NetBackup backups.</td>
</tr>
<tr>
<td></td>
<td>The volume that NetBackup creates contain a required Veritas Partner Key. If you use the AT&amp;T Synaptic interface to create the volume, it does not contain the partner key. Consequently, that volume cannot accept data from NetBackup.</td>
</tr>
<tr>
<td></td>
<td>■ The logical storage unit (LSU) name (that is, volume name) must be 50 or fewer characters. You can use the following characters for the volume name:</td>
</tr>
<tr>
<td></td>
<td>■ Any of the 26 letters of the International Standards Organization (ISO) Latin-script alphabet, both uppercase (capital) letters and lowercase (small) letters. These are the same letters as the English alphabet.</td>
</tr>
<tr>
<td></td>
<td>■ Any integer from 0 to 9, inclusive.</td>
</tr>
<tr>
<td></td>
<td>■ Any of the following characters:</td>
</tr>
<tr>
<td></td>
<td>` # $ _ - ' ,</td>
</tr>
<tr>
<td></td>
<td>■ You must have an AT&amp;T Synaptic account user name and password.</td>
</tr>
</tbody>
</table>

NetBackup supports the private clouds from the supported cloud providers.

See “About private clouds from AT&T” on page 18.

More information about AT&T Synaptic is available from AT&T.

http://www.business.att.com/enterprise/Family/cloud/storage/

About private clouds from AT&T

NetBackup supports the private clouds for AT&T cloud storage. When you configure a private cloud in NetBackup, you specify the internal host of the cloud. Two methods exist to specify the internal host, as follows:
Specify the internal host in the **Cloud Storage Configuration Wizard**  
1. On the select media server panel of the **Cloud Storage Configuration Wizard**, click **Advanced Settings**.
2. On the **Advanced Server Configuration** dialog box, select **Override storage server** and enter the name of the host to use as the storage server.

With this method, the **Create an account with service provider** link on the wizard media server panel has no value for your configuration process.

Specify the internal host in a configuration file  
If you specify the name of the internal host in a configuration file, the **Cloud Storage Configuration Wizard** uses that host as the cloud storage server.

1. Open the appropriate configuration file, as follows:
   - **UNIX:**
     
     ```
     /usr/openv/java/cloudstorejava.conf
     ```
   - **Windows:**
     
     ```
     C:\Program Files\Veritas\NetBackup\bin\cloudstorewin.conf
     ```

2. In the section of the file for your cloud provider type, change the value of the following parameter to the internal host:

   ```
   DEFAULT_STORAGE_SERVER_NAME
   ```

   Use the fully qualified host name or ensure that your network environment can resolve the host name to an IP address.

3. If you want the **Create an account with service provider** link on the wizard panel to open a different Web page, edit the following parameter to use that different URL:

   ```
   CLOUD_PROVIDER_URL
   ```

   **Note:** To configure a public cloud from your vendor, you must do one of two things: change the configuration file to its original contents or specify the internal host in the **Cloud Storage Configuration Wizard**.

Before you configure a private cloud in NetBackup, it must be set up and available. See “**Configuring a storage server for cloud storage**” on page 46.
About the Cloudian HyperStore storage requirements

NetBackup Cloud Storage enables NetBackup to backup data to and restore data from Cloudian.

Table 2-5 describes the details and requirements of Cloudian in NetBackup. Cloudian HyperStore uses the Amazon S3 protocol for its storage.

### Table 2-5 Cloudian requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>License requirement</td>
<td>You must have a NetBackup Data Protection Optimization Option license key.</td>
</tr>
<tr>

<td>For more details on the bucket requirements (for example, the maximum number of buckets that you can create), contact Cloudian cloud provider.</td>
</tr>
</tbody>
</table>
| Bucket names                     | Veritas recommends that you use NetBackup to create the buckets that you use with NetBackup. The Amazon S3 interface may allow the characters that NetBackup does not allow. Consequently, by using NetBackup to create the buckets you can limit the potential problems. The following are the NetBackup requirements for bucket names:  
  - Bucket names must be at least 3 and no more than 63 characters long.  
  - Bucket names can contain lowercase letters, numbers, and dashes (hyphens). |
| Number of disk pools             | You can create a maximum of 90 disk pools. Attempts to create more than 90 disk pools generate a “failed to create disk volume, invalid request” error message. |

About the Google Nearline cloud storage requirements

NetBackup Cloud Storage enables NetBackup to backup data to and restore data from Google Nearline.
**Note:** Among the Standard, Durable Reduced Availability (DRA), and Nearline storage classes by Google cloud, NetBackup supports only Nearline storage class. When you create a Google cloud storage, NetBackup by default uses the Nearline storage class.

Table 2-6 describes the details and requirements of Google Nearline in NetBackup. Google Nearline uses the Amazon S3 protocol for its storage.

<table>
<thead>
<tr>
<th>Requirement</th>

</tr>
</thead>
<tbody>
<tr>
<td>License requirement</td>
<td>You must have a NetBackup Data Protection Optimization Option license key.</td>
</tr>
<tr>
<td>Hitachi account</td>
<td>You must obtain a Hitachi Cloud Services account and the associated user name and password. You must also obtain a Hitachi Cloud Services access ID and secure access token.</td>
</tr>
<tr>
<td>requirements</td>
<td></td>
</tr>
<tr>
<td>Buckets</td>
<td>For more details on the bucket requirements (for example, the maximum number of buckets that you can create), contact Hitachi cloud provider. <strong>Note:</strong> Hitachi refers to buckets as namespaces.</td>
</tr>
</tbody>
</table>
| Bucket names          | Veritas recommends that you use NetBackup to create the buckets that you use with NetBackup. The Amazon S3 interface may allow the characters that NetBackup does not allow. Consequently, by using NetBackup to create the buckets you can limit the potential problems. The following are the NetBackup requirements for bucket names:  
  ■ Bucket names must be at least 3 and no more than 63 characters long.  
  ■ Bucket names can contain lowercase letters, numbers, and dashes (hyphens). |
| Number of disk pools  | You can create a maximum of 90 disk pools. Attempts to create more than 90 disk pools generate a “failed to create disk volume, invalid request” error message. |

About Rackspace Cloud Files storage requirements

NetBackup Cloud Storage enables Veritas NetBackup to backup data to and restore data from Rackspace Cloud Files™.

Table 2-8 describes the details and requirements of Rackspace CloudFiles.
### About Rackspace Cloud Files storage requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rackspace Cloud Files accounts</td>
<td>You must obtain a Rackspace account. The account has a user name and password. You need to follow the Rackspace process to generate an access key. The user name and access key are required when you configure the storage server.</td>
</tr>
<tr>
<td>Storage requirements</td>
<td>The following are the requirements for Rackspace CloudFiles:</td>
</tr>
<tr>
<td></td>
<td>■ You must have a NetBackup Data Protection Optimization Option license key.</td>
</tr>
<tr>
<td></td>
<td>■ You must have a Rackspace Cloud Files account user name and password.</td>
</tr>
<tr>
<td></td>
<td>■ You must use NetBackup to create the cloud storage volume for your NetBackup backups.</td>
</tr>
<tr>
<td></td>
<td>The volume that NetBackup creates contains a required Veritas Partner Key. If you use the Cloud Files interface to create the volume, it does not contain the partner key. Consequently, that volume cannot accept data from NetBackup.</td>
</tr>
<tr>
<td></td>
<td>■ You can use the following characters in the volume name:</td>
</tr>
<tr>
<td></td>
<td>■ Any of the 26 letters of the International Standards Organization (ISO) Latin-script alphabet, both uppercase (capital) letters and lowercase (small) letters. These are the same letters as the English alphabet.</td>
</tr>
<tr>
<td></td>
<td>■ Any integer from 0 to 9, inclusive.</td>
</tr>
<tr>
<td></td>
<td>■ Any of the following characters:</td>
</tr>
<tr>

<td>' ~ ! @ # $ % ^ * ( ) _ + =</td>
</tr>
</tbody>
</table>

NetBackup supports the private clouds from the supported cloud providers.

See “About private clouds from Rackspace” on page 23.

More information about Rackspace Cloud Files is available from Rackspace.  

http://www.rackspace.com/cloud/files

### About private clouds from Rackspace

NetBackup supports the private clouds from Rackspaces. When you configure a private cloud in NetBackup, you specify the internal host of the cloud. Two methods exist to specify the internal host, as follows:
Specify the internal host in the Cloud Storage Configuration Wizard

1. On the select media server panel of the Cloud Storage Configuration Wizard, click Advanced Settings.
2. On the Advanced Server Configuration dialog box, select Override storage server and enter the name of the host to use as the storage server.

With this method, the Create an account with service provider link on the wizard media server panel has no value for your configuration process.

Specify the internal host in a configuration file

If you specify the name of the internal host in a configuration file, the Cloud Storage Configuration Wizard uses that host as the cloud storage server.

1. Open the appropriate configuration file, as follows:
   - UNIX:
     /usr/openv/java/cloudstorejava.conf
   - Windows:
     C:\Program Files\Veritas\NetBackup\bin\cloudstorewin.conf
2. In the section of the file for your cloud provider type, change the value of the following parameter to the internal host:
   ```
   DEFAULT_STORAGE_SERVER_NAME
   ```
   Use the fully qualified host name or ensure that your network environment can resolve the host name to an IP address.
3. If you want the Create an account with service provider link on the wizard panel to open a different Web page, edit the following parameter to use that different URL:
   ```
   CLOUD_PROVIDER_URL
   ```

Note: To configure a public cloud from your vendor, you must do one of two things: change the configuration file to its original contents or specify the internal host in the Cloud Storage Configuration Wizard.

Before you configure a private cloud in NetBackup, it must be set up and available.

See “Configuring a storage server for cloud storage” on page 46.

About the Verizon cloud storage requirements

NetBackup Cloud Storage enables NetBackup to backup data to and restore data from Verizon.
Table 2-9 describes the details and requirements of Verizon in NetBackup. Verizon uses the Amazon S3 protocol for its storage.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>License requirement</td>
<td>You must have a NetBackup Data Protection Optimization Option license key.</td>
</tr>
<tr>
<td>Verizon account requirements</td>
<td>You must obtain a Verizon account and the associated user name and password. You also must obtain a Verizon access ID and secure access token.</td>
</tr>
<tr>
<td>Buckets</td>
<td>Verizon does not support creating buckets in NetBackup. For more details on creating buckets through Verizon portal, contact Verizon cloud provider.</td>
</tr>
</tbody>
</table>
| Bucket names       | Verizon does not support creating buckets in NetBackup. While creating buckets through Verizon portal, make sure that you take the following NetBackup requirements into consideration:  
  ■ Bucket names must be at least 3 and no more than 63 characters long.  
  ■ Bucket names can contain lowercase letters, numbers, and dashes (or hyphens). |
| Number of disk pools | You can create a maximum of 90 disk pools. Attempts to create more than 90 disk pools generate a "failed to create disk volume, invalid request" error message. |

About private clouds from Amazon S3-compatible cloud providers

NetBackup supports the private clouds or cloud instances from the following Amazon S3-compatible cloud providers:

- Amazon GovCloud
- Cloudian HyperStore
- Hitachi
- Verizon

Before you configure a private cloud in NetBackup, it must be deployed and available.
Use the Advanced Server Configuration dialog box

On the select media server panel of the Cloud Storage Configuration Wizard, click the Advanced Settings option. Then, in the Advanced Server Configuration dialog box, select the relevant options from the following: Use SSL, Use Proxy Server, HTTP Headers, and so on.

**Note:** NetBackup supports only Certificate Authority (CA)-signed certificates while it communicates with cloud storage in the SSL mode. Ensure that the cloud server (public or private) has CA-signed certificate. If it does not have the CA-signed certificate, data transfer between NetBackup and cloud provider fails in the SSL mode.

**Note:** The FIPS region of Amazon GovCloud cloud provider (that is s3-fips-us-gov-west-1.amazonaws.com) supports only secured mode of communication. Therefore, if you disable the Use SSL option while you configure Amazon GovCloud cloud storage with the FIPS region, the configuration fails.

The Create an account with service provider link on the wizard panel opens a cloud provider webpage in which you can create an account. If you configure a private cloud, that webpage has no value for your configuration process.

**Use the NetBackup csconfig command**

You can use the NetBackup csconfig command to create custom cloud instances for an Amazon S3-compatible cloud provider. You must run the csconfig command before you run the nbdevconfig and tpconfig commands. The following is an example of the csconfig command syntax:

```
csconfig -a -in instance_name -pt provider_type -sh service_host_name [-se service_endpoint_path] [-http_port port_no] [-https_port port_no] [-access_style access_style_type]
```

See the NetBackup Commands Reference Guide for a complete description about the commands. The guide is available at the following location:

http://www.veritas.com/docs/DOC5332
Configuring cloud storage in NetBackup

This chapter includes the following topics:

- Configuring cloud storage in NetBackup
- Cloud installation requirements
- Scalable Storage properties
- About the NetBackup CloudStore Service Container
- Deploying a security certificate on a NetBackup host
- About data compression for cloud backups
- About data encryption for cloud storage
- About key management for encryption of NetBackup cloud storage
- About cloud storage servers
- About the NetBackup media servers for cloud storage
- Configuring a storage server for cloud storage
- Assigning a storage class to cloud storage
- Changing cloud storage server properties
- NetBackup cloud storage server properties
- About cloud storage disk pools
- Configuring a disk pool for cloud storage
Configuring cloud storage in NetBackup

This topic describes how to configure cloud storage in NetBackup. Table 3-1 provides an overview of the tasks to configure cloud storage. Follow the steps in the table in sequential order.

The *NetBackup Administrator's Guide, Volume I* describes how to configure a base NetBackup environment. The *NetBackup Administrator's Guide, Volume I* is available through the following URL:

http://www.veritas.com/docs/DOC5332

Table 3-1  Overview of the NetBackup cloud configuration process

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>More information</th>
</tr>

</thead>
</table>
| Step 6 | Provision a security certificate for authentication on the media servers | See "NetBackup CloudStore Service Container security certificates" on page 36.  
See "Deploying a security certificate on a NetBackup host " on page 40. |
| Step 7 | Understand key management for encryption                               | Encryption is optional.  
See "About data encryption for cloud storage" on page 43.  
See "About key management for encryption of NetBackup cloud storage" on page 43. |
| Step 8 | Configure the storage server                                          | See "About cloud storage servers" on page 45.  
See "Configuring a storage server for cloud storage" on page 46. |
| Step 9 | Configure the disk pool                                               | See "About cloud storage disk pools" on page 85.  
See "Configuring a disk pool for cloud storage" on page 86. |
| Step 10| Configure additional storage server properties                        | See "NetBackup cloud storage server properties" on page 76.  
See "Changing cloud storage server properties" on page 74. |
| Step 11| Add additional media servers                                          | Adding additional media servers is optional.  
See "About the NetBackup media servers for cloud storage" on page 45.  
See "Adding backup media servers to your cloud environment" on page 97. |
| Step 12| Configure a storage unit                                              | See "Configuring a storage unit for cloud storage" on page 99. |
| Step 13| Configure NetBackup Accelerator and optimized synthetic backups       | Accelerator and optimized synthetic backups are optional.  
See "About NetBackup Accelerator and NetBackup Optimized Synthetic backups" on page 103.  
See "Enabling NetBackup Accelerator with cloud storage" on page 103.  
See "Changing cloud storage server properties" on page 74. |
| Step 14| Configure a backup policy                                             | See "Creating a backup policy" on page 107. |
Cloud installation requirements

When you develop a plan to implement a NetBackup Cloud solution, use Table 3-2 to assist with your plan.

### Table 3-2 Cloud installation requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetBackup media server platform support</td>
<td>For the operating systems that NetBackup supports for cloud storage, see the NetBackup operating system compatibility list available through the following URL: <a href="http://www.netbackup.com/compatibility">http://www.netbackup.com/compatibility</a> When you install the NetBackup media server software on your host, ensure that you specify the fully-qualified domain name for the NetBackup server name.</td>
</tr>
<tr>
<td>Cloud storage provider account</td>
<td>You must have an account created with your preferred cloud storage provider before you configure NetBackup Cloud Storage. Please refer to the list of available NetBackup cloud storage providers. You can create this account in the Cloud Storage Configuration Wizard. See “About the cloud storage providers” on page 13.</td>
</tr>
<tr>
<td>NetBackup cloud storage licensing</td>
<td>NetBackup cloud storage is enabled through the NetBackup Data Protection Optimization Option license key. To use NetBackup Accelerator with NetBackup cloud storage, you must install the Data Protection Optimization Option license key. That license key activates the NetBackup Accelerator feature.</td>
</tr>
</tbody>
</table>

### Scalable Storage properties

The **Scalable Storage Cloud Settings** properties contain information about encryption, metering, bandwidth throttling, and network connections between the NetBackup hosts and your cloud storage provider.

The **Scalable Storage** properties appear only if you install a NetBackup Data Protection Optimization Option license key.

The **Scalable Storage** properties apply to currently selected media servers.
Table 3-3 describes the properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key Management Server (KMS) Name</strong></td>
<td>If you configured the NetBackup Key Management Service (KMS), the name of the KMS server.</td>
</tr>
<tr>
<td><strong>Metering Interval</strong></td>
<td>Determines how often NetBackup gathers connection information for reporting purposes. NetBackup OpsCenter uses the information that is collected to create reports. The value is set in seconds. The default setting is 300 seconds (5 minutes). If you set this value to zero, metering is disabled.</td>
</tr>
<tr>
<td><strong>Total Available Bandwidth</strong></td>
<td>Use this value to specify the speed of your connection to the cloud. The value is specified in kilobytes per second. The default value is 102400 KB/sec.</td>
</tr>
<tr>
<td><strong>Sampling interval</strong></td>
<td>The time, in seconds, between measurements of bandwidth usage. The larger this value, the less often NetBackup checks to determine the bandwidth in use.</td>
</tr>
</tbody>
</table>
Table 3-3  Cloud storage host properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Settings</td>
<td>Click <strong>Advanced Settings</strong> to specify additional settings for throttling. See “Configuring advanced bandwidth throttling settings” on page 32. See “Advanced bandwidth throttling settings” on page 33.</td>
</tr>
</tbody>
</table>
| Maximum concurrent jobs | The default maximum number of concurrent jobs that the media server can run for the cloud storage server.  
This value applies to the media server not to the cloud storage server. If you have more than one media server that can connect to the cloud storage server, each media server can have a different value. Therefore, to determine the total number of connections to the cloud storage server, add the values from each media server.  
If you configure NetBackup to allow more jobs than the number of connections, NetBackup fails any jobs that start after the number of maximum connections is reached. Jobs include both backup and restore jobs.  
You can configure job limits per backup policy and per storage unit.  
**Note:** NetBackup must account for many factors when it starts jobs: the number of concurrent jobs, the number of connections per media server, the number of media servers, and the job load-balancing logic. Therefore, NetBackup may not fail jobs exactly at the maximum number of connections. NetBackup may fail a job when the connection number is slightly less than the maximum, exactly the maximum, or slightly more than the maximum.  
In practice, you should not need to set this value higher than 100. |

Configuring advanced bandwidth throttling settings

Advanced bandwidth throttling settings let you control various aspects of the connection between the NetBackup hosts and your cloud storage provider.

The total bandwidth and the bandwidth sampling interval are configured on the **Cloud Settings** tab of the **Scalable Storage** host properties screen.

See “Scalable Storage properties” on page 30.

**To configure advanced bandwidth throttling settings**

1. In the **NetBackup Administration Console**, expand **NetBackup Management > Host Properties > Media Servers** in the left pane.
2. In the right pane, select the host on which to specify properties.
3. Click **Actions > Properties**.
4. In the properties dialog box left pane, select **Scalable Storage**.
In the right pane, click **Advanced Settings**. The **Advanced Throttling Configuration** dialog box appears.

The following is an example of the dialog box:

![Advanced Throttling Configuration dialog box](image)

Configure the settings and then click **OK**.

See “**Advanced bandwidth throttling settings**” on page 33.

### Advanced bandwidth throttling settings

The following table describes the advanced bandwidth throttling settings.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Read Bandwidth</strong></td>
<td>Use this field to specify the percentage of total bandwidth that read operations can use. Specify a value between 0 and 100. If you enter an incorrect value, an error is generated.</td>
</tr>
<tr>
<td></td>
<td>If there is insufficient bandwidth to transmit the specified amount of data within a few minutes, restore or replication failures may occur due to timeouts.</td>
</tr>
<tr>
<td></td>
<td>Consider the total load of simultaneous jobs on multiple media servers when you calculate the required bandwidth.</td>
</tr>
<tr>
<td>Default value: <strong>100</strong></td>
<td>Possible values: 0 to 100</td>
</tr>
</tbody>
</table>
### Table 3-4  Advanced Throttling Configuration settings (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Write Bandwidth** | Use this field to specify the percentage of total bandwidth that write operations can use. Specify a value between 0 and 100. If you enter an incorrect value, an error is generated.  
If there is insufficient bandwidth to transmit the specified amount of data within a few minutes, backup failures may occur due to timeouts.  
Consider the total load of simultaneous jobs on multiple media servers when you calculate the required bandwidth.  
**Default value:** 100  
**Possible values:** 0 to 100 |
| **Work time**    | Use this field to specify the time interval that is considered work time for the cloud connection.  
Specify a start time and end time in 24-hour format. For example, 2:00 P.M. is 14:00.  
Indicate how much bandwidth the cloud connection can use in the **Allocated bandwidth** field. This value determines how much of the available bandwidth is used for cloud operations in this time window. The value is expressed as a percentage or in kilobytes per second. |
| **Off time**     | Use this field to specify the time interval that is considered off time for the cloud connection.  
Specify a start time and end time in 24-hour format. For example, 2:00 P.M. is 14:00.  
Indicate how much bandwidth the cloud connection can use in the **Allocated bandwidth** field. This value determines how much of the available bandwidth is used for cloud operations in this time window. The value is expressed as a percentage or in kilobytes per second. |
| **Weekend**      | Specify the start and stop time for the weekend.  
Indicate how much bandwidth the cloud connection can use in the **Allocated bandwidth** field. This value determines how much of the available bandwidth is used for cloud operations in this time window. The value is expressed as a percentage or in kilobytes per second. |

<tbody>
<tr>
<td>Read Bandwidth (KB/s)</td>
<td>This field displays how much of the available bandwidth the cloud storage server transmits to a NetBackup media server during each restore job. The value is expressed in kilobytes per second.</td>
</tr>
<tr>
<td>Write Bandwidth (KB/s)</td>
<td>This field displays how much of the available bandwidth the NetBackup media server transmits to the cloud storage server during backup jobs. The value is expressed in kilobytes per second.</td>
</tr>
</tbody>
</table>

About the NetBackup CloudStore Service Container

The NetBackup CloudStore Service Container (nbcssc) is a web-based service container that runs on the NetBackup media servers that are configured for cloud storage. This container hosts different services such as the configuration service, the throttling service, and the metering data collector service. NetBackup OpsCenter uses the metering data for monitoring and reporting.

See “About the NetBackup media servers for cloud storage” on page 45.

You can configure the NetBackup CloudStore Service Container behavior by using the Scalable Storage host properties in the NetBackup Administration Console.

See “Scalable Storage properties” on page 30.

The NetBackup CloudStore Service Container is a highly available service in a clustered environment. The failure of this service does not result in NetBackup resource group to failover. In case of a NetBackup resource group failover, this service fails over to another node.

The default port number for the NetBackup CloudStore Service Container service is 5637.

See “Stopping and starting the NetBackup CloudStore Service Container” on page 135.

NetBackup uses several methods of security for the NetBackup CloudStore Service Container, as follows:
Security certificates

The NetBackup media server on which the NetBackup CloudStore Service Container runs must be provisioned with a security certificate.

See “NetBackup CloudStore Service Container security certificates” on page 36.

See "Deploying a security certificate on a NetBackup host " on page 40.

Note: You do not need to generate a security certificate, if you have already generated it before configuring the cloud storage.

Security modes

The NetBackup CloudStore Service Container can run in different security modes.

See “NetBackup CloudStore Service Container security modes” on page 37.

NetBackup CloudStore Service Container security certificates

The NetBackup CloudStore Service Container requires a digital security certificate so that it starts and runs. How the security certificate is provisioned depends on the release level of NetBackup, as follows:

NetBackup 7.7 and later

The NetBackup Authentication Service generates certificates for media server authentication, which is the certificate that the CloudStore Service Container uses. You must use a command to install a certificate on a media server that you use for cloud storage.

See “Deploying a security certificate on a NetBackup host ” on page 40.

Note: You do not need to generate a security certificate, if you have already generated it before configuring the cloud storage.

The security certificates that the NetBackup Authentication Service generates expire after one year. NetBackup automatically replaces existing certificates with new ones as needed.

Note: The security certificates that are provisioned for other NetBackup features or purposes satisfy the certificate requirement for the CloudStore Service Container. The NetBackup Access Control feature uses security certificates, and the NetBackup Administration Console requires security certificates for interhost communication.
The CloudStore Service Container generates a self-signed certificate for authentication. The certificate expires after 365 days. The CloudStore Service Container automatically replaces existing certificates with new ones as needed.

The CloudStore Service Container in NetBackup releases earlier than 7.7 does not recognize the certificates that a NetBackup 7.7 or later master server generates. If your security policy prohibits self-signed certificates, you must run NetBackup 7.7 or later on the media servers that you use for cloud storage.

Where the media server security certificates reside depend on the release level of NetBackup, as follows:

NetBackup releases earlier than 7.7

The certificate name is the host name that you used when you configured the NetBackup media server software on the host. The path for the certificate is as follows, depending on operating system:

- UNIX/Linux: /usr/openv/var/vxss/credentials
- Windows: \install_dir\Veritas\NetBackup\var\VxSS\credentials

If a certificate does not exist, create one from the NetBackup master server.

NetBackup 7.7 and later

The following are the pathnames to the certificate, depending on operating system:

- UNIX/Linux: /usr/openv/lib/ost-plugins/cssc.crt
- Windows: \install_path\Veritas\NetBackup\bin\ost-plugins\cssc.crt

If the certificate becomes corrupt or expires, delete the old certificate and restart the service to regenerate a new certificate.

See “About the NetBackup CloudStore Service Container” on page 35.

NetBackup CloudStore Service Container security modes

The NetBackup CloudStore Service Container can run in one of two different modes. The security mode determines how the clients communicate with the service, as follows:

Secure mode

In the default secure mode, the client components must authenticate with the CloudStore Service Container. After authentication, communication occurs over a secure HTTPS channel.
Non-secure mode

The CloudStore Service Container uses non-secure communication. Clients communicate with the server over HTTP with no authentication required.

You can use the `CSSC_IS_SECURE` attribute of the `cloudstore.conf` file to set the security mode. The default value is 1, secure communication.

See “NetBackup cloudstore.conf configuration file” on page 38.

See “About the NetBackup CloudStore Service Container” on page 35.

NetBackup cloudstore.conf configuration file

Table 3-5 describes the `cloudstore.conf` configuration file parameters. The `cloudstore.conf` file is available on all media servers that are installed on the platforms that NetBackup supports. You can modify most of these parameters manually.

---

**Note:** You must stop the `nbcssc` service before you modify any of the parameters in the `cloudstore.conf` file. Once you modify the parameters, restart the `nbcssc` service.

---

The `cloudstore.conf` file resides in the following directories:

- UNIX or Linux: `/usr/openv/netbackup/db/cloud`
- Windows: `install_path\Netbackup\db\cloud`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSSC_VERSION</td>
<td>Veritas recommends that you do not modify this value.</td>
</tr>
<tr>
<td></td>
<td>Specifies the version of <code>cloudstore.conf</code> file. The default value is 1.</td>
</tr>
<tr>
<td>CSSC_PLUGIN_PATH</td>
<td>Veritas recommends that you do not modify this value.</td>
</tr>
<tr>
<td></td>
<td>Specifies the path where NetBackup cloud storage plug-ins are installed.</td>
</tr>
<tr>
<td></td>
<td>The default path is as follows:</td>
</tr>
<tr>
<td></td>
<td>On Windows: <code>install_path\Veritas\NetBackup\bin\ost-plugins</code></td>
</tr>
<tr>
<td></td>
<td>On UNIX: <code>/usr/openv/lib/ost-plugins</code></td>
</tr>
</tbody>
</table>
Table 3-5  cloudstore.conf configuration file parameters and descriptions (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSSC_PORT</td>
<td>Specifies the port number for the CloudStore Service Container (nbcssc). The default value is 5637.</td>
</tr>
</tbody>
</table>
| CSSC_LOG_DIR          | Specifies the directory path where nbcssc generates log files. The default path is as follows:  
                         On Windows: `install_path\Veritas\NetBackup\logs\nbcssc`  
                         On UNIX: `/usr/openv/netbackup/logs/nbcssc`                 |
| CSSC_LOG_FILE         | Specifies the file name that the nbcssc service uses to write its logs. The default value is empty, which means that the NetBackup logging mechanism determines the log file name. |
| CSSC_IS_SECURE        | Specifies if the nbcssc service runs in secure (value 1) or non-secure mode (value 0). The default value is 1.                              |
| CSSC_CIPHER_LIST      | Veritas recommends that you do not modify this value.  
                         Specifies the cipher list that NetBackup uses while it communicates with the nbcssc service in the secure (SSL) mode. The default value is `HIGH:MEDIUM:!aNULL:!aNULL:!SSLv2:!RC4`. |
| CSSC_LOG_LEVEL        | Specifies the log level for nbcssc logging. Value 0 indicates that the logging is disabled and non-zero value indicates that the logging is enabled. The default value is 0. |
| CSSC_MASTER_PORT      | Specifies the port number of NetBackup master server host where the nbcssc service runs. The default value is 5637.                         |
| CSSC_MASTER_NAME      | Specifies the NetBackup master server name. This entry indicates that the nbcssc service runs on this host. It processes all cloud provider-specific requests based on the CloudProvider.xml and CloudInstance.xml files that reside at the following location:  
                         On Windows: `install_path\Netbackup\db\cloud`  
                         On UNIX: `/usr/openv/netbackup/db/cloud`    |
| CSSC_MASTER_IS_SECURE | Specifies if the nbcssc service is running in secure (value 1) or non-secure mode (value 0) on the NetBackup master server. The default value is 1. |
Deploying a security certificate on a NetBackup host

NetBackup hosts may require a security certificate for authentication for various purposes. If so, you must use a NetBackup command to deploy a certificate for each host that requires one.

See “NetBackup CloudStore Service Container security certificates” on page 36.

Choose one of the following procedures to deploy a security certificate on NetBackup hosts. You must be a NetBackup administrator to deploy certificates.

### Deploying a security certificate for media servers

This procedure uses IP address verification to identify the target NetBackup host and then deploy the certificate.

With this procedure, you can deploy a certificate for an individual media server or for all media servers.

See Deploying a security certificate for media servers or clients.

### Creating a host identity and then deploying a security certificate for a media server

This procedure requires that you run a command on the NetBackup master server to create an identity for the target host. Then, you must run a command on the target host to obtain the certificate from the master server.

With this procedure, you can deploy a certificate for an individual host.

See Creating a host identity and then deploying a security certificate for a media server or client.

**Note:** Deploying a security certificate is a one-time activity for a given NetBackup host. If a certificate was deployed for an earlier release or for a hotfix, it does not need to be done again.

Choose one of the following procedures to deploy a security certificate on NetBackup hosts:

**Deploying a security certificate for media servers or clients**

This procedure works well when deploying certificates to many hosts at one time. As with NetBackup deployment in general, this method assumes that the network is secure.
To deploy a security certificate for media servers

1. Run the following command on the master server, depending on your environment. Specify the name of an individual media server or specify `-AllMediaServers`.
   - **Windows:** `install_path\NetBackup\bin\admincmd\bpnbaz -ProvisionCert host_name|-AllMediaServers`
   - **UNIX:** `/usr/openv/netbackup/bin/admincmd/bpnbaz -ProvisionCert host_name|-AllMediaServers`
   - **NetBackup appliance (as a NetBackupCLI user):** `bpnbaz -ProvisionCert Media_server_name`

2. Restart the NetBackup Service Layer service on the master server.

Creating a host identity and then deploying a security certificate for a media server or client

This procedure works best when deploying certificates to a small number of hosts. The same password must be entered once on the master server, and then again on the target host, so this method is considered to be more secure.

To create a host identity and then deploy a security certificate for a media server

1. Run the following command on the master server to create an identity for the target NetBackup host.
   - **Windows:** `install_path\NetBackup\bin\bpbat –addmachine target_hostname`
   - **UNIX:** `/usr/openv/netbackup/bin/bpbat –addmachine target_hostname`
   Enter a password of your choice when prompted and make a note of it.

2. Run the following command on the target NetBackup host to obtain a certificate from the master server and deploy it:
   - **Windows:** `install_path\NetBackup\bin\bpbat –loginmachine`
   - **UNIX:** `/usr/openv/netbackup/bin/bpbat –loginmachine`
   Enter the master server name as the authentication broker name when prompted. Enter the same computer name and password that were used to create the target host identity on the master server.

**Note:** If a target host has multiple host names, repeat the steps for each host name.
About data compression for cloud backups

In NetBackup, you can compress your data before you send it to cloud storage server.

You can enable data compression on the NetBackup media server while you configure your cloud storage server using the Cloud Storage Server Configuration Wizard.

See “Configuring a storage server for cloud storage” on page 46.

**Note:** The compression option is available only for Amazon S3-compatible cloud providers.

After you have enabled the data compression during the cloud storage configuration, you cannot disable it.

**Important notes about data compression in NetBackup**

- NetBackup media servers that are older than the 7.7.3 version do not support data compression. Therefore, if you have selected an older media server while you configure the cloud storage server, the compression option does not appear on the Cloud Storage Server Configuration Wizard.
- NetBackup uses a third-party library, LZO Pro, with compression level 3.
- NetBackup compresses data in chunks of 256 KB.
- NetBackup Accelerator and True Image Restore (TIR) with move detection is supported with compression.
- The backup data is compressed before it is transmitted to the cloud storage server. If both the compression and the encryption options are selected, the data is compressed before it is encrypted.
- Data compression reduces the backup time and the data size based on how much the data is compressible. Although you may notice reduced bandwidth utilization when you compare it with the data without compression.
- Performance of the data compression is reduced, if the data is incompressible. Therefore, Veritas recommends not to enable compression for backing up incompressible data such as policy data and so on.
- Veritas recommends not to use the same bucket with storage servers of different types.
- You must not use client-side compression along with storage server-side compression.
About data encryption for cloud storage

You can encrypt your data before you send it to the cloud. The NetBackup Cloud Storage Server Configuration Wizard and the Disk Pool Configuration Wizard include the steps that configure key management and encryption.

NetBackup uses the Key Management Service (KMS) to manage the keys for the data encryption for cloud disk storage. KMS is a NetBackup master server-based symmetric key management service. The service runs on the NetBackup master server. An additional license is not required to use the KMS functionality.

See “About key management for encryption of NetBackup cloud storage” on page 43.

More information about data-at-rest encryption and security is available.

See the NetBackup Security and Encryption Guide:
http://www.veritas.com/docs/DOC5332

About key management for encryption of NetBackup cloud storage

NetBackup uses the Key Management Service (KMS) to manage the keys for the data encryption for disk storage. KMS is a NetBackup master server-based symmetric key management service. The service runs on the NetBackup master server. An additional license is not required to use the KMS functionality.

NetBackup uses KMS to manage the encryption keys for cloud storage.

See “About data encryption for cloud storage” on page 43.

The following table describes the keys that are required for the KMS database. You can enter the pass phrases for these keys when you use the Cloud Storage Server Configuration Wizard.

<table>
<thead>
<tr>
<th>Table 3-6</th>
<th>Encryption keys required for the KMS database</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Host Master Key</td>
<td>The Host Master Key protects the key database. The Host Master Key requires a pass phrase and an ID. KMS uses the pass phrase to generate the key.</td>
</tr>
<tr>
<td>Key Protection Key</td>
<td>A Key Protection Key protects individual records in the key database. The Key Protection Key requires a pass phrase and an ID. KMS uses the pass phrase to generate the key.</td>
</tr>
</tbody>
</table>
The following table describes the encryption keys that are required for each storage server and volume combination. If you specify encryption when you configured the cloud storage server, you must configure a pass phrases for the key group for the storage volumes. You enter the pass phrase for these keys when you use the Disk Pool Configuration Wizard.

Table 3-7  Encryption keys and key records for each storage server and volume combination

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key group key</td>
<td>A key group key protects the key group. Each storage server and volume combination requires a key group, and each key group key requires a pass phrase. The key group name must use the format for the storage type that is described as follows:</td>
</tr>
<tr>
<td></td>
<td>For cloud storage, the following is the format:</td>
</tr>
<tr>
<td></td>
<td>storage_server_name:volume_name</td>
</tr>
<tr>
<td></td>
<td>The following items describe the requirements for the key group name components for cloud storage:</td>
</tr>
<tr>
<td></td>
<td>■ storage_server_name: You must use the same name that you use for the storage server. The name can be a fully-qualified domain name or a short name, but it must be the same as the storage server.</td>
</tr>
<tr>
<td></td>
<td>■ The colon (:) is required after the storage_server_name.</td>
</tr>
<tr>
<td></td>
<td>■ volume_name: You must specify the LSU name that the storage vendor exposes to NetBackup.</td>
</tr>
<tr>
<td></td>
<td>The Disk Pool Configuration Wizard conforms to this format when it creates a key group.</td>
</tr>
<tr>
<td>Key record</td>
<td>Each key group that you create requires a key record. A key record stores the actual key that protects the data for the storage server and volume.</td>
</tr>
<tr>
<td></td>
<td>A name for the key record is optional. If you use a key name, you can use any name. Veritas recommends that you use the same name as the volume name. The Disk Pool Configuration Wizard does not prompt for a key record key; it uses the volume name as the key name.</td>
</tr>
</tbody>
</table>

More information about KMS is available in the NetBackup Security and Encryption Guide:

http://www.veritas.com/docs/DOC5332
About cloud storage servers

A storage server is an entity that writes data to and reads data from the storage. For cloud storage, it is not a NetBackup host. Usually, it is a host that your cloud storage vendor exposes to the Internet and to which you send the backup data. Your storage vendor provides the name of the storage server. Use that name when you configure cloud storage in NetBackup.

When you configure a cloud storage server, it inherits the NetBackup Scalable Storage properties.

See “Scalable Storage properties” on page 30.

After you configure the storage server, you can change the properties of the storage server.

See “Changing cloud storage server properties” on page 74.

Only one storage server exists in a NetBackup domain for a specific storage vendor.

NetBackup media servers back up the clients and send the data to the storage server.

See “About the NetBackup media servers for cloud storage” on page 45.

About the NetBackup media servers for cloud storage

The NetBackup media servers that you use for cloud storage backup the NetBackup clients and then send that backup data to the cloud storage server. The storage server then writes the data to storage.

See “About cloud storage servers” on page 45.

The NetBackup media servers also can move data back to primary storage (the client) during restores and from secondary storage to tertiary storage during duplication. These media servers are also known as data movers. They host a software plug in that they use to communicate with the storage implementation.

When you configure a cloud storage server, the media server that you specify in the wizard or on the command line becomes a cloud storage data mover.

See “Configuring a storage server for cloud storage” on page 46.

You can add additional media servers to backup clients. They can help balance the load of the backups that you send to the cloud storage.

See “Adding backup media servers to your cloud environment” on page 97.
You can control which data movers are used for backups and duplications when you configure NetBackup storage units.

See “Configuring a storage unit for cloud storage” on page 99.

To support cloud storage, a media server must conform to the following items:

■ The operating system must be supported for cloud storage. For the operating systems that NetBackup supports for cloud storage, see the NetBackup operating system compatibility list available through the following URL: http://www.netbackup.com/compatibility

■ The NetBackup Cloud Storage Service Container (nbcssc) must be running.
  See “About the NetBackup CloudStore Service Container” on page 35.

■ For Amazon S3-compatible cloud providers, the media server must run a NetBackup 7.7 or later release.

■ The NetBackup media servers that you use for cloud storage must be the same NetBackup version as the master server.

### Configuring a storage server for cloud storage

Configure in this context means to configure a host as a storage server that can write to and read from the cloud storage. The NetBackup **Cloud Storage Server Configuration Wizard** communicates with your cloud storage vendor’s network and selects the appropriate host for the storage server.

See “About cloud storage servers” on page 45.

The wizard also lets you configure the NetBackup Key Management Service for encryption.

See “About data encryption for cloud storage” on page 43.

If you configure encryption, Veritas recommends that you save a record of the key names.

See “Saving a record of the KMS key names for NetBackup cloud storage encryption” on page 94.

The NetBackup media server that you select during the configuration process must conform to the requirements for cloud storage.

See “About the NetBackup media servers for cloud storage” on page 45.

NetBackup supports private clouds from the supported cloud providers.

See “About private clouds from AT&T” on page 18.

See “About private clouds from Amazon S3-compatible cloud providers” on page 25.
To configure a cloud storage server by using the wizard

1. In the **NetBackup Administration Console** connected to the NetBackup master server, select either **NetBackup Management** or **Media and Device Management**.

2. In the right pane, click **Configure Cloud Storage Servers**.

3. Click **Next** on the welcome panel of the wizard.

   The **Select cloud provider** panel appears.

   The following is an example of the wizard panel:

   ![Cloud Storage Server Configuration Wizard - NetBackup (on hope66)](image)

   On the **Select cloud provider** panel, either select the cloud provider or in the search box type the cloud provider name that you want to select. If the cloud provider that you have entered exists in the list, the wizard selects it.

   Click **Next**; a wizard panel for the selected cloud provider appears.
4 On the wizard panel for your cloud provider, select or enter the appropriate information. The information that is required depends on the cloud vendor. Descriptions of the information that is required for each provider is provided in other topics. Those topics also include examples of the wizard panels.

Note: The provider information topics may include notes, caveats, or warnings. Ensure that you review the topics before you complete the fields in the wizard panel.

See “Amazon S3 storage server configuration options” on page 54.
See “Amazon GovCloud storage server configuration options” on page 51.
See “AT&T storage server configuration options” on page 56.
See “Cloudian HyperStore storage server configuration options” on page 58.
See “Google Nearline storage server configuration options” on page 61.
See “Hitachi storage server configuration options” on page 64.
See “Rackspace storage server configuration options” on page 67.
See “Verizon storage server configuration options” on page 68.

After you specify the configuration options for your cloud provider, click Next; the Specify compression and encryption settings panel appears.

5 Specify the following settings on the Specify compression and encryption settings panel.

Note: NetBackup media servers that are older than the 7.7.3 version do not support data compression. Therefore, if you have selected an older media server, the compression option does not appear on the panel.

Caution: If you use NetBackup commands to add a pre-7.7.3 media server to a cloud storage environment that uses compression, cloud backups may fail. Ensure that all media servers that you add to a cloud storage configuration with the compression are NetBackup 7.7.3 or later.

The following is an example of the panel:
To compress your backup data, select **Compress data before writing to cloud storage**.

**Note**: The compression option is available only for Amazon S3-compatible cloud providers.

See “About data compression for cloud backups” on page 42.

To encrypt your backups, select **Encrypt data using AES-256 before writing to cloud storage**. Then, enter the information to protect the KMS database.

See “KMS database encryption settings” on page 71.

Click **Next**; the **Cloud Storage Server Configuration Summary** panel appears.
On the **Cloud Storage Server Configuration Summary** panel, verify the selections.

The following is an example of the panel:

If not OK, click **Back** until you reach the panel on which you need to make corrections.

If OK, click **Next**. The wizard creates the storage server, and the **Storage Server Creation Confirmation** panel appears.

**7** On the **Storage Server Creation Confirmation** panel, do one of the following:

- To continue to the **Disk Pool Configuration Wizard**, click **Next**. See “Configuring a disk pool for cloud storage” on page 86.
- To exit from the wizard, click **Finish**. If you exit, you can still create a disk pool. See “Configuring a disk pool for cloud storage” on page 86.
Amazon GovCloud storage server configuration options

Figure 3-2 shows the Cloud Storage Configuration Wizard for Amazon GovCloud cloud storage.

You can select the correct ones even if you only have access to the keystore file. To perform a disaster recovery you must remember the correct IDs and the pass phrases that are associated with the files.</td>
</tr>
</tbody>
</table>

After you configure the storage server and disk pool, Veritas recommends that you save a record of the key names.

See “Saving a record of the KMS key names for NetBackup cloud storage encryption” on page 94.

**Assigning a storage class to cloud storage**

You can assign a storage class to cloud storage while you configure a new storage server.

See “About Amazon S3 storage classes” on page 16.

See “Configuring a storage server for cloud storage” on page 46.

**To assign a storage class**

1. In the NetBackup Administration Console > Cloud Storage Configuration wizard, select Amazon.

2. On the Add Storage Server screen, specify the Amazon S3 configuration details such as, service host, storage server name, and access details.

3. Click Advanced Settings.
4 On the **Advanced Server Configuration** screen, the **x-amz-storage-class** header shows the Amazon S3 storage classes that NetBackup supports. Click the **Value** column to select any of the available storage classes - **STANDARD** or **STANDARD_IA** - as shown in the following screen:

5 Click **Ok**.

**Note:** Veritas recommends that you do not modify the storage class of a cloud storage server, after you have assigned it.

6 Configure a new disk pool.

See “Configuring a disk pool for cloud storage” on page 86.

**Note:** Veritas recommends that you use different buckets for different storage classes.

7 Configure a new storage unit by accessing **NetBackup Administration Console > NetBackup Management > Storage > Storage Units**.

8 Modify the existing policy or SLP (or create new policy or SLP) to use the new storage unit by accessing the respective user interfaces:
Changing cloud storage server properties

The Change Storage Server dialog box lists all storage server properties. You can change these properties, if required.

See “Configuring cloud storage in NetBackup” on page 28.

To change storage server properties

1 In the NetBackup Administration Console, expand Media and Device Management > Credentials > Storage Server.
2 Select the storage server.
3 On the Edit menu, select Change.
In the Change Storage Server dialog box, select the Properties tab.

The following is an example of the Properties for Amazon S3 storage server of type amazon_raw:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMZ:PROXY_TYPE</td>
<td>NONE</td>
<td>Specify CURL proxy</td>
</tr>
<tr>

<td>100</td>
<td>bandwidth percent for reads</td>
</tr>
<tr>
<td>THR:WRITE_BANDW</td>
<td>100</td>
<td>bandwidth percent for writes</td>
</tr>
</tbody>
</table>

To change a property, select its value in the Value column and then change it.

See “NetBackup cloud storage server properties” on page 76.

See “NetBackup storage server cloud connection properties” on page 76.

Repeating encryption properties” on page 84.

Repeat step 5 until you have finishing changing properties.

Click OK.

Restart the NetBackup Remote Manager and Monitor Service (nbrmms) by using the NetBackup Administration Console Activity Monitor.
NetBackup cloud storage server properties

The Properties tab of the Change Storage Server dialog box lets you change some of the properties that affect the NetBackup interaction with the cloud storage.

Not all properties apply to all storage vendors.

Table 3-17 describes the prefixes for the various properties.

<table>

See “Changing cloud storage server properties” on page 74.

See “NetBackup cloud storage server bandwidth throttling properties” on page 81.

See “NetBackup cloud storage server encryption properties” on page 84.

See “NetBackup storage server cloud connection properties” on page 76.

NetBackup storage server cloud connection properties

All or most of the cloud storage servers use the storage server properties in Table 3-18. The following are the prefixes for the currently supported cloud vendors:
- Amazon: AMZ
- Amazon GovCloud: AMZGOV
- AT&T: ATT
- Cloudian: CLD
- Google Nearline: GOOG
- Hitachi: HT
- Rackspace: RACKS
- Verizon: VER

Table 3-18  Storage server cloud connection properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| METER:DIRECTORY           | This read-only field displays the directory in which to store data stream metering information.  
 Default value: /usr/openv/netbackup/db/cloud (UNIX) or install_path\VERITAS\NetBackup\db\cloud (Windows)  |
| METER:INTERVAL            | The interval at which NetBackup gathers connection information for reporting purposes.  
 NetBackup OpsCenter uses the information that is collected to create reports.  
 The value is set in seconds. The default setting is 300 seconds (5 minutes).  
 If you set this value to zero, metering is disabled  
 To change this property, use the Cloud Settings tab of the Scalable Storage host properties.  
 See “Scalable Storage properties” on page 30.  
 Default value: 300  
 Possible values: 1 to 10000 |
| PREFIX: CURL_CONNECT_TIMEOUT | The amount of time that is allocated for the media server to connect to the cloud storage server. This value is specified in seconds. The default is 300 seconds or five minutes.  
 This only limits the connection time, not the session time. If the media server cannot connect to the cloud storage server in the specified time, the job fails.  
 This value cannot be disabled. If an invalid number is entered, the CURL_CONNECT_TIMEOUT returns to the default value of 300.  
 Default value: 300  
 Possible values: 1 to 10000 |
### Table 3-18 Storage server cloud connection properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>PREFIX:CURL_TIMEOUT</code></td>
<td>The maximum time in seconds to allow for the completion of a data operation. This value is specified in seconds. If the operation does not complete in the specified time, the operation fails. The default is 900 seconds (15 minutes). To disable this timeout, set the value to 0 (zero). Default value: 900 Possible values: 1 to 10000</td>
</tr>
<tr>
<td><code>PREFIX:LOG_CURL</code></td>
<td>Determines if cURL activity is logged. The default is NO which means log activity is disabled. Default value: NO Possible values: NO (disabled) and YES (enabled)</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PREFIX:READ_BUFFER_SIZE</td>
<td>The size of the buffer to use for read operations. READ_BUFFER_SIZE is specified in bytes. To enable the use of the buffer, set this value to a non-zero number. Veritas recommends that this value be a multiple of 256. The READ_BUFFER_SIZE determines the size of the data packets that the storage server transmits during each restore job. An increase in the value may increase performance when a large amount of contiguous data is accessed. If insufficient bandwidth exists to transmit the specified amount of data within a few minutes, restore failures may occur due to timeouts. When you calculate the required bandwidth, consider the total load of simultaneous backup jobs and restore jobs on multiple media servers. Default value for Amazon S3-compatible cloud providers: 104875600 (100 MB) Default value for cloud providers other than Amazon S3-compatible providers: 0 Possible values for Amazon S3-compatible cloud providers: 1048756 (1 MB) to 1073741824 (1 GB) Possible values for cloud providers other than Amazon S3-compatible providers: 524288 (512 KB) to 1073741824 (1 GB)</td>
</tr>
<tr>
<td>PREFIX:USE_SSL</td>
<td>Determines if Secure Sockets Layer encryption is used for the control APIs. The default value is YES, meaning SSL is enabled. Default value: YES Possible values: YES or NO</td>
</tr>
<tr>
<td>PREFIX:USE_SSL_RW</td>
<td>Determines if Secure Sockets Layer encryption is used for read and write operations. The default value is YES, meaning SSL is enabled. Default value: YES Possible values: YES or NO</td>
</tr>
<tr>
<td>PREFIX:WRITE_BUFFER_NUM</td>
<td>This parameter is not applicable for Amazon S3-compatible cloud providers. This read-only field displays the total number of write buffers that are used by the plug-in. The WRITE_BUFFER_SIZE value defines the size of the buffer. The value is set to 1 and cannot be changed. Default value: 1 Possible values: 1</td>
</tr>
</tbody>
</table>

Configuring cloud storage in NetBackup

NetBackup cloud storage server properties
### Table 3-18  
**Storage server cloud connection properties (continued)**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| PREFIX:WRITE_BUFFER_SIZE  | The size of the buffer to use for write operations. WRITE_BUFFER_SIZE is specified in bytes.  
To disable the use of the buffer, set this value to 0 (zero).  
The WRITE_BUFFER_SIZE value determines the size of the data packs transmitted from the data mover to the storage server during a backup. An increase in the value may increase performance when a large amount of contiguous data is accessed. If insufficient bandwidth exists to transmit the specified amount of data within a few minutes, backup failures may occur due to timeouts. When you calculate the required bandwidth, consider the total load of simultaneous backup jobs and restore jobs on multiple media servers.  
Default value for Amazon S3-compatible cloud providers: **104875600** (100 MB)  
Default value for cloud providers other than Amazon S3-compatible cloud providers: **10485760** (10 MB)  
Possible values for all cloud providers: **1048576** (1 MB) to **1073741824** (1 GB) |
| HTTP:User-Agent           | This is applicable only for Amazon S3-compatible cloud providers.  
You cannot edit this property.                                                                                                           |
| HTTP:x-amz-server-side-encryption | This is applicable only for the following cloud providers: Amazon S3 and Amazon GovCloud  
Use this property to enable the server-side encryption of the data that you need to transfer to the cloud storage.  
AES-256 is a server-side encryption standard.  
Set this property to NONE to disable the server-side encryption for the cloud provider.  
**Note:** You should not enable this property, if you have already enabled the media server-side encryption option while configuring cloud storage server using the NetBackup Administration Console. |

See “Changing cloud storage server properties” on page 74.  
See “NetBackup cloud storage server properties” on page 76.
NetBackup cloud storage server bandwidth throttling properties

The following storage server properties apply to bandwidth throttling. The THR prefix specifies a throttling property. Use the correct cloud provider URL for the desired cloud vendor.

To change these properties, use the Scalable Storage host properties Cloud Settings tab.

See “Scalable Storage properties” on page 30.

Table 3-19  Cloud storage server bandwidth throttling properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| THR:storage_server    | Shows maximum number of concurrent jobs that can be run for a specific cloud storage server.  
                         | Default value: Not applicable  
                         | Possible values: See Description |
| THR:AVAIL_BANDWIDTH   | This read-only field displays the total available bandwidth value for the cloud feature. The value is displayed in bytes per second. You must specify a number greater than zero. If you enter zero, an error is generated.  
                         | Default value: 104857600  
                         | Possible values: Any positive integer |
Table 3-19  Cloud storage server bandwidth throttling properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>THR:DEFAULT_MAX_CONNECTIONS</strong></td>
<td>The default maximum number of concurrent jobs that the media server can run for the cloud storage server. If THR:storage_server is set, NetBackup uses THR:storage_server instead of THR:DEFAULT_MAX_CONNECTIONS. This is a read-only field. This value applies to the media server not to the cloud storage server. If you have more than one media server that can connect to the cloud storage server, each media server can have a different value. Therefore, to determine the total number of jobs that can run on the cloud storage server, add the values from each media server. If NetBackup is configured to allow more jobs than THR:DEFAULT_MAX_CONNECTIONS, NetBackup fails any jobs that start after the number of maximum jobs is reached. Jobs include both backup and restore jobs. You can configure job limits per backup policy and per storage unit. See the NetBackup Administrator’s Guide, Volume I: <a href="http://www.veritas.com/docs/DOC5332">http://www.veritas.com/docs/DOC5332</a> Note: NetBackup must account for many factors when it starts jobs: the number of concurrent jobs, the number of THR:DEFAULT_MAX_CONNECTIONS per media server, the number of media servers, and the job load-balancing logic. Therefore, NetBackup may not fail jobs exactly at the maximum number of connections. NetBackup may fail a job when the connection number is slightly less than the maximum, exactly the maximum, or slightly more than the maximum. In practice, you should not need to set this value higher than 100. Default value: 10 Possible values: 1 to 2147483647</td>
</tr>
<tr>
<td><strong>THR:OFF_TIME_BANDWIDTH_PERCENT</strong></td>
<td>This read-only field displays the bandwidth percent that is used during off time. Default value: 100 Possible values: 0 to 100</td>

**NetBackup cloud storage server encryption properties**

The following encryption-specific storage server properties are used by all or most of the storage vendors. The CRYPT prefix specifies an encryption property. These values are for display purposes only and cannot be changed.
Table 3-20  Encryption cloud storage server properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| CRYPT:KMS_SERVER  | This read-only field displays NetBackup server that hosts the KMS service. When you set the storage server properties, enter the name of the KMS server host. By default, this field contains the NetBackup master server name. You cannot change this value.  
  Default value: The NetBackup master server name  
  Possible values: N/A |
| CRYPT:KMS_VERSION | This read-only field displays the NetBackup Key Management Service version. You cannot change this value.  
  Default value: 16  
  Possible values: N/A |
| CRYPT:LOG_VERBOSE | This read-only field displays if logs are enabled for encryption activities. The value is either yes for logging or no for no logging.  
  Default value: no  
  Possible values: yes and no |
| CRYPT:VERSION     | This read-only field displays the encryption version. You cannot change this value.  
  Default value: 13107  
  Possible values: N/A |

See “Changing cloud storage server properties” on page 74.

About cloud storage disk pools

A disk pool represents disk volumes on the underlying disk storage. A disk pool is the storage destination of a NetBackup storage unit. For cloud storage, you must specify only one volume for a disk pool.

Disk pool and disk volume names must be unique within your cloud storage provider’s environment.

See “Configuring a disk pool for cloud storage” on page 86.

If a cloud storage disk pool is a storage destination in a storage lifecycle policy, NetBackup capacity management applies.

See the NetBackup Administrator's Guide, Volume I:
Configuring a disk pool for cloud storage

Use the NetBackup Disk Pool Configuration Wizard to create a disk pool for cloud storage. If you create encrypted storage, you must enter a pass phrase for each selected volume that uses encryption. The pass phrase creates the encryption key for that volume.

To configure a cloud storage disk pool by using the wizard

1. If the Disk Pool Configuration Wizard was launched from the Storage Server Configuration Wizard, go to step 5.

   Otherwise, in the NetBackup Administration Console, select either NetBackup Management or Media and Device Management.

2. From the list of wizards in the right pane, click Configure Disk Pool.
3 On the **Welcome** panel, the types of disk pools that you can configure depend on the types of storage servers that exist in your environment.

The following is an example of the wizard panel:

![Disk Pool Configuration Wizard](image)

Read the information on the welcome panel of the wizard. Then, select the appropriate storage server type and click **Next**.

The **Storage Server Selection** panel appears.
4 On the **Storage Server Selection** panel, the storage servers that you configured for the selected storage server type appear.

The following is an example of the wizard panel:

![Disk Pool Configuration Wizard](image)

Select the storage server for this disk pool.

After you select the cloud storage server, click **Next**. The **Volume Selection** wizard panel appears.
The **Volume Selection** panel displays the volumes that have been created already under your account within the vendor's cloud storage.

**Note:** The following properties do not apply to cloud storage disk pools: **Total available space**, **Total raw size**, **Low water mark**, and **High water mark**.

All these values are derived from the storage capacity, which cannot be fetched from the cloud provider.

The following is an example of the wizard panel:

![Disk Pool Configuration Wizard](image)

To add a volume, click **Add New Volume**. A dialog box appears that contains the information that is required for a volume for your cloud vendor. In that dialog box, enter the required information. Use the following link to find the information about the requirements for the volume names.
See “About the cloud storage providers” on page 13.

To select a volume, click the check box for the volume. You can select one volume only.

After you select the volume for the disk pool, click Next. The behavior of the wizard depends on whether you configured encryption for the storage server, as follows:

- **No encryption**
  - If you selected a volume on a storage destination that does not require encryption, the Additional Disk Pool Information panel appears.
  - Go to the next step, step 6.

- **Encryption**
  - If you selected a volume on a storage destination that requires encryption, a Settings dialog box appears in which you must enter an encryption pass phrase. The pass phrase is for the key group key for this storage volume and storage server combination.
  - See “About key management for encryption of NetBackup cloud storage” on page 43.
  - After you enter a pass phrase and then click OK in the Settings dialog box, the dialog box closes. Click Next in the Volume Selection wizard panel to continue to the Additional Disk Pool Information wizard panel.
  - Continue to the next step, step 6.
On the **Additional Disk Pool Information** panel, enter or select the properties for this disk pool.

The following is an example of the wizard panel:

![Disk Pool Configuration Wizard](image)

- **Storage server type**: `amazon_crypt`
- **Disk Pool Size**
  - Total available space: `---`
  - Total raw size: `---`
- **Disk Pool name**: 
- **Comments**: 
- **High water mark**: `98`%
- **Low water mark**: `80`%

*The High water mark and Low water mark values are not applicable for this disk group.*

- **Maximum I/O Streams**
  - Concurrent read and write jobs affect disk performance.
  - Limit I/O streams to prevent disk overload.
  - Limit I/O streams: 

See “Cloud storage disk pool properties” on page 110.

After you enter the additional disk pool information, click **Next**. The **Summary** panel appears.
On the **Summary** panel, verify the selections.

The following is an example of the wizard panel:

![Disk Pool Configuration Wizard](image)

If the summary shows your selections accurately, click **Next**.

Veritas recommends that you save the KMS key group name and the KMS key name. They are required to recover the keys.

See “**Saving a record of the KMS key names for NetBackup cloud storage encryption**” on page 94.
After NetBackup creates the disk pool, a wizard panel describes the successful action.

The following is an example of the wizard panel:

![Disk Pool Configuration Wizard](image)

After NetBackup creates the disk pool, you can do the following:

Configure a storage unit  Ensure that **Create a storage unit using the disk pool that you have just created** is selected and then click **Next**. The **Storage Unit Creation** wizard panel appears. Continue to the next step.

Exit  Click **Close**.

You can configure one or more storage units later.

See “Configuring a storage unit for cloud storage” on page 99.
On Storage Unit Creation wizard panel, enter the appropriate information for the storage unit.

The following is an example of the wizard panel:

![Disk Pool Configuration Wizard](image)

See “Cloud storage unit properties” on page 100.

After you enter or select the information for the storage unit, click Next to create the storage unit.

You can use storage unit properties to control your backup traffic.

See “Configure a favorable client-to-server ratio” on page 102.

See “Control backup traffic to the media servers” on page 103.

10 After NetBackup configures the storage unit, the Finished panel appears. Click Finish to exit from the wizard.

**Saving a record of the KMS key names for NetBackup cloud storage encryption**

Veritas recommends that you save a record of the encryption key names and tags. The key tag is necessary if you need to recover or recreate the keys.
See “About data encryption for cloud storage” on page 43.
To save a record of the key names

1. To determine the key group names, use the following command on the master server:

   **UNIX:** `/usr/openv/netbackup/bin/admincmd/nbkmsutil -listkgs`
   
   **Windows:** `install_path\Program Files\Veritas\NetBackup\bin\admincmd\nbkmsutil.exe -listkgs`

   The following is example output:

   
<table>
<thead>
<tr>
<th>Key Group Name</th>
<th>: CloudVendor.com:symc_backups_gold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported Cypher</td>
<td>: AES_256</td>
</tr>
<tr>
<td>Number of Keys</td>
<td>: 1</td>
</tr>
<tr>
<td>Has Active Key</td>
<td>: Yes</td>
</tr>
<tr>
<td>Creation Time</td>
<td>: Tues Oct 01 01:00:00 2013</td>
</tr>
<tr>
<td>Last Modification Time</td>
<td>: Tues Oct 01 01:00:00 2013</td>
</tr>
<tr>
<td>Description</td>
<td>: CloudVendor.com:symc_backups_gold</td>
</tr>
</tbody>
</table>
For each key group, write all of the keys that belong to the group to a file. Run the command on the master server. The following is the command syntax:

**UNIX:**
```
/usr/openv/netbackup/bin/admincmd/nbkmsutil -listkeys -kgname key_group_name > filename.txt
```

**Windows:**
```
install_path\Program Files\Veritas\NetBackup\bin\admincmd\nbkmsutil.exe -listkeys -kgname key_group_name > filename.txt
```

The following is example output:

```
nbkmsutil.exe -listkeys -kgname CloudVendor.com:symc_backups_gold > encrypt_keys_CloudVendor.com_symc_backups_gold.txt
```

Key Group Name : CloudVendor.com:symc_backups_gold
Supported Cypher : AES_256
Number of Keys : 1
Has Active Key : Yes
Creation Time : Tues Jan 01 01:00:00 2013
Last Modification Time : Tues Jan 01 01:00:00 2013
Description : Key group to protect cloud volume
FIPS Approved Key : Yes

Key Tag : 532cf41cc8b3513a13c1c26b5128731e
          5ca0b9b01e0689cc38ac2b7596bbae3c
Key Name : Encrypt_Key_April
Current State : Active
Creation Time : Tues Jan 01 01:02:00 2013
Last Modification Time : Tues Jan 01 01:02:00 2013
Description : -
Number of Keys: 1

Include in the file the pass phrase that you used to create the key record.

Store the file in a secure location.

**Adding backup media servers to your cloud environment**

You can add additional media servers to your cloud environment. Additional media servers can help improve backup performance. Such servers are known as *data movers*. The media servers that you add are assigned the credentials for the storage server. The credentials allow the data movers to communicate with the storage server.
A NetBackup media server must conform to the requirements for cloud storage.
See “About the NetBackup media servers for cloud storage” on page 45.

**Adding backup media servers to your cloud environment**

1. In the NetBackup Administration Console, expand **Media and Device Management > Credentials > Storage Servers**.

2. Select the cloud storage server.

3. From the **Edit** menu, select **Change**.

4. In the **Change Storage Server** dialog box, select the **Media Servers** tab.

5. Select the media server or servers that you want to enable for cloud backup. The media servers that you select are configured as cloud servers.

| Note: For Amazon S3-compatible cloud providers, only NetBackup 7.7 and later media servers are available for selection. |

6. Click **OK**.

7. For AT&T and Rackspace cloud providers only, do the following:

   a. Copy the appropriate configuration file from the media server that you specified when you configured the storage server. The file name depends on your storage vendor. The following is the format:

      `libstspiVendorName.conf`

      The file resides in the following directory, depending on operating system:

      - **UNIX and Linux**: `/usr/openv/netbackup/db/cloud/
      - **Windows**: `install_path\VERITAS\NetBackup\db\cloud`

   b. Save the file to the appropriate directory on the media server or servers that you added, as follows:

      - **UNIX and Linux**: `/usr/openv/netbackup/db/cloud/
      - **Windows**: `install_path\VERITAS\NetBackup\db\cloud`

| Caution: If you do not copy the `libstspiVendorName.conf` to the new media server, any backups that attempt to use the media server fail. The backups fail with a NetBackup Status Code 83 (media open error). |

8. Modify disk pools, storage units, and policies as desired.
Configuring a storage unit for cloud storage

Create one or more storage units that reference the disk pool.

The **Disk Pool Configuration Wizard** lets you create a storage unit; therefore, you may have created a storage unit when you created a disk pool. To determine if storage units exist for the disk pool, see the **NetBackup Management > Storage > Storage Units** window of the Administration Console.

A storage unit inherits the properties of the disk pool. If the storage unit inherits replication properties, the properties signal to a NetBackup storage lifecycle policy the intended purpose of the storage unit and the disk pool. Auto Image Replication requires storage lifecycle policies.

You can use storage unit properties to control your backup traffic.

See "Configure a favorable client-to-server ratio" on page 102.

See "Control backup traffic to the media servers" on page 103.
To configure a storage unit from the Actions menu

1. In the NetBackup Administration Console, expand NetBackup Management > Storage > Storage Units.

2. On the Actions menu, select New > Storage Unit.

3. Complete the fields in the New Storage Unit dialog box.

   See “Cloud storage unit properties” on page 100.

Cloud storage unit properties

The following are the configuration options for a cloud disk pool storage unit.

<table>
<thead>
<tr>
<th>Table 3-21</th>
<th>Cloud storage unit properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>Storage unit name</td>
<td>A unique name for the new storage unit. The name can describe the type of storage. The storage unit name is the name used to specify a storage unit for policies and schedules. The storage unit name cannot be changed after creation.</td>
</tr>
</tbody>
</table>
Table 3-21 Cloud storage unit properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage unit type</td>
<td>Select Disk as the storage unit type.</td>
</tr>
<tr>
<td>Disk type</td>
<td>Select Cloud Storage (type) for the disk type. type represents the disk pool type, based on storage vendor, encryption, and so on.</td>
</tr>
<tr>
<td>Disk pool</td>
<td>Select the disk pool that contains the storage for this storage unit. All disk pools of the specified Disk type appear in the Disk pool list. If no disk pools are configured, no disk pools appear in the list.</td>
</tr>
</tbody>
</table>
| Media server              | The Media server setting specifies the NetBackup media servers that can backup clients and move the data to the cloud storage server. The media servers can also move the data for restore or duplication operations. Specify the media server or servers as follows:  
  ■ To allow any server in the media server list to deduplicate data, select Use any available media server.  
  ■ To use specific media servers to deduplicate the data, select Only use the following media servers. Then, select the media servers to allow.  
  NetBackup selects the media server to use when the policy runs.                                                                                                                                 |
| Maximum concurrent jobs   | The Maximum concurrent jobs setting specifies the maximum number of jobs that NetBackup can send to a disk storage unit at one time. (Default: one job. The job count can range from 0 to 256.) This setting corresponds to the Maximum concurrent write drives setting for a Media Manager storage unit.  
  NetBackup queues jobs until the storage unit is available. If three backup jobs are scheduled and Maximum concurrent jobs is set to two, NetBackup starts the first two jobs and queues the third job. If a job contains multiple copies, each copy applies toward the Maximum concurrent jobs count.  
  Maximum concurrent jobs controls the traffic for backup and duplication jobs but not restore jobs. The count applies to all servers in the storage unit, not per server. If you select multiple media servers in the storage unit and 1 for Maximum concurrent jobs, only one job runs at a time.  
  The number to enter depends on the available disk space and the server's ability to run multiple backup processes.  
  Warning: A Maximum concurrent jobs setting of 0 disables the storage unit.                                                                                                                                 |
Table 3-21  Cloud storage unit properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum fragment size</td>
<td>For normal backups, NetBackup breaks each backup image into fragments so it does not exceed the maximum file size that the file system allows. You can enter a value from 20 MBs to 51200 MBs.</td>
</tr>
<tr>
<td></td>
<td>For a FlashBackup policy, Veritas recommends that you use the default, maximum fragment size to ensure optimal duplication performance.</td>
</tr>
</tbody>
</table>

Configure a favorable client-to-server ratio

You can use storage unit settings to configure a favorable client-to-server ratio. You can use one disk pool and configure multiple storage units to separate your backup traffic. Because all storage units use the same disk pool, you do not have to partition the storage.

For example, assume that you have 100 important clients, 500 regular clients, and four media servers. You can use two media servers to back up your most important clients and two media servers to back up your regular clients.

The following example describes how to configure a favorable client-to-server ratio:

- Configure the media servers for NetBackup deduplication and configure the storage.
- Configure a disk pool.
- Configure a storage unit for your most important clients (such as STU-GOLD). Select the disk pool. Select **Only use the following media servers**. Select two media servers to use for your important backups.
- Create a backup policy for the 100 important clients and select the STU-GOLD storage unit. The media servers that are specified in the storage unit move the client data to the deduplication storage server.
- Configure another storage unit (such as STU-SILVER). Select the same disk pool. Select **Only use the following media servers**. Select the other two media servers.
- Configure a backup policy for the 500 regular clients and select the STU-SILVER storage unit. The media servers that are specified in the storage unit move the client data to the deduplication storage server.

Backup traffic is routed to the wanted data movers by the storage unit settings.
**Note:** NetBackup uses storage units for media server selection for write activity (backups and duplications) only. For restores, NetBackup chooses among all media servers that can access the disk pool.

---

**Control backup traffic to the media servers**

On disk pool storage units, you can use the **Maximum concurrent jobs** settings to control the backup traffic to the media servers. Effectively, this setting directs higher loads to specific media servers when you use multiple storage units for the same disk pool. A higher number of concurrent jobs means that the disk can be busier than if the number is lower.

For example, two storage units use the same set of media servers. One of the storage units (STU-GOLD) has a higher **Maximum concurrent jobs** setting than the other (STU-SILVER). More client backups occur for the storage unit with the higher **Maximum concurrent jobs** setting.

---

**About NetBackup Accelerator and NetBackup Optimized Synthetic backups**

NetBackup Cloud Storage supports NetBackup Accelerator and NetBackup Optimized Synthetics. Encryption, metering, and throttling are functional and supported when you enable NetBackup Accelerator or NetBackup Optimized Synthetic backups. You enable both NetBackup Accelerator and NetBackup Optimized Synthetic backups in the same way as non-Cloud backups. More information about NetBackup Accelerator and NetBackup Optimized Synthetic backups is available.

- [Veritas NetBackup Deduplication Guide](http://www.veritas.com/docs/DOC5332)
- [Veritas NetBackup Administrator's Guide, Volume I](http://www.veritas.com/docs/DOC5332)

These guides are available through the following URL:

http://www.veritas.com/docs/DOC5332

---

**Enabling NetBackup Accelerator with cloud storage**

Use the following procedure to enable NetBackup Accelerator for use with NetBackup cloud storage.
Enabling Accelerator for use with NetBackup cloud storage

1. In the NetBackup Administration Console, select **NetBackup Management > Policies > policy_name**. Select **Edit > Change**, and select the **Attributes** tab.

2. Select **Use accelerator**.

3. Confirm the **Policy storage** option is a valid Cloud storage unit.

The storage unit that is specified under **Policy storage** must be one of the supported Cloud vendors. You can’t set **Policy storage** to **Any Available**.

**Figure 3-10** Enable Accelerator

Determining if NetBackup Accelerator was used during a backup operation

1. In the NetBackup Administration Console, select **Activity Monitor**. Double click the backup that you want to check.

2. Click the **Detailed Status** tab.

3. Review the status for **accelerator enabled**. This text indicates the backup used NetBackup Accelerator.
Enabling optimized synthetic backups with cloud storage

Optimized Synthetic backups require three backup schedules. You must have a Full backup, an Incremental backup, and a Full Backup with Synthetic backup enabled. You can use either a Differential incremental or a Cumulative incremental for the incremental backup. You must then perform a full backup, then at least one incremental backup, and finally a full backup with synthetic enabled. The final backup is the optimized synthetic backup.

**Note:** In the case of Hitachi cloud configuration, the True Image Restore (TIR) or synthetic backups do not work, if you have enabled the encryption option. To successfully run the TIR or synthetic backups, you need to enable the versioning option for buckets (or namespaces) through the Hitachi cloud portal. For more details on how to enable the versioning option, contact Hitachi cloud provider.
Enabling Optimized Synthetic backups for use with NetBackup Cloud Storage

1. In the NetBackup Administration Console, select NetBackup Management > Policies > policy_name. Select Edit > Change, and select the Attributes tab.

2. Select Collect true image restore information and with move detection.

3. Confirm the Policy storage option is a valid Cloud storage unit.

   The storage unit that is specified under Policy storage must be one of the supported Cloud vendors. You can’t set Policy storage to Any Available.

Figure 3-12  Enable Optimized Synthetic backups

Determining if a backup was an Optimized Synthetic backup

1. In the NetBackup Administration Console, select Activity Monitor. Double click the backup that you want to check.

2. Click the Detailed Status tab.

3. Review the status for Performing Optimized Synthetic Operation. This text indicates the backup was an Optimized Synthetic backup.
Creating a backup policy

The easiest method to set up a backup policy is to use the Policy Configuration Wizard. This wizard guides you through the setup process by automatically choosing the best values for most configurations.

Not all policy configuration options are presented through the wizard. For example, calendar-based scheduling and the Data Classification setting. After the policy is created, modify the policy in the Policies utility to configure the options that are not part of the wizard.

**Note:** Do not use the Policy Configuration Wizard to configure policies for Replication Director.

**Using the Policy Configuration Wizard to create a backup policy**

Use the following procedure to create a backup policy with the Policy Configuration Wizard.
To create a backup policy with the Policy Configuration Wizard

1. In the NetBackup Administration Console, in the left pane, click NetBackup Management.
2. In the right pane, click Create a Policy to begin the Policy Configuration Wizard.
3. Select File systems, databases, applications.
4. Click Next to start the wizard and follow the prompts.

Click Help on any wizard panel for assistance while running the wizard.

Creating a backup policy without using the Policy Configuration Wizard

Use the following procedure to create a backup policy in the NetBackup Administration Console without using the Policy Configuration Wizard.

To create a policy without the Policy Configuration Wizard

1. In the NetBackup Administration Console, in the left pane, expand NetBackup Management > Policies.
2. On the Actions menu, click New > Policy.
3. Type a unique name for the new policy in the Add a New Policy dialog box.
4. If necessary, clear the Use Policy Configuration Wizard check box.
5. Click OK.
6. Configure the attributes, the schedules, the clients, and the backup selections for the new policy.

Changing cloud storage disk pool properties

You can change some of the properties of a disk pool.

To change disk pool properties

1. In the NetBackup Administration Console, expand Media and Device Management > Devices > Disk Pools.
2. Select the disk pool that you want to change in the details pane.
3 On the Edit menu, select Change.

4 Change the properties as necessary.
   See “Cloud storage disk pool properties” on page 110.

5 Click OK.
Cloud storage disk pool properties

The properties of a disk pool may vary depending on the purpose the disk pool.

**Note:** The following properties do not apply to cloud storage disk pools: **Total available space**, **Total raw size**, **Usable Size**, **Low water mark**, and **High water mark**.

All these values are derived from the storage capacity, which cannot be fetched from the cloud provider.

The following table describes the possible properties:

**Table 3-22**  
Cloud storage disk pool properties

<table>
<thead>
<tr>
<th>Property</th>

<td><strong>Note:</strong> <strong>Low water mark</strong> does not apply to cloud storage disk pools.</td>
</tr>
</tbody>
</table>
Table 3-22  Cloud storage disk pool properties *(continued)*

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit I/O streams</td>
<td>Select to limit the number of read and write streams (that is, jobs) for each volume in the disk pool. A job may read backup images or write backup images. By default, there is no limit.</td>
</tr>
<tr>
<td></td>
<td>When the limit is reached, NetBackup chooses another volume for write operations, if available. If not available, NetBackup queues jobs until a volume is available.</td>
</tr>
<tr>
<td></td>
<td>Too many streams may degrade performance because of disk thrashing. Disk thrashing is excessive swapping of data between RAM and a hard disk drive. Fewer streams can improve throughput, which may increase the number of jobs that complete in a specific time period.</td>
</tr>
<tr>
<td></td>
<td>A starting point is to divide the <strong>Maximum concurrent jobs</strong> of all of the storage units by the number of volumes in the disk pool.</td>
</tr>
<tr>
<td>per volume</td>
<td>Select or enter the number of read and write streams to allow per volume.</td>
</tr>
<tr>
<td></td>
<td>Many factors affect the optimal number of streams. Factors include but are not limited to disk speed, CPU speed, and the amount of memory.</td>
</tr>
<tr>
<td></td>
<td>For the disk pools that are configured for <strong>Snapshot</strong> and that have a <strong>Replication source</strong> property:</td>
</tr>
<tr>
<td></td>
<td>□ Always use increments of 2 when you change this setting. A single replication job uses two I/O streams.</td>
</tr>
<tr>
<td></td>
<td>□ If more replication jobs exist than streams are available, NetBackup queues the jobs until streams are available.</td>
</tr>
<tr>
<td></td>
<td>□ Batching can cause many replications to occur within a single NetBackup job. Another setting affects snapshot replication job batching.</td>
</tr>
</tbody>
</table>
Monitoring and Reporting

This chapter includes the following topics:

■ About monitoring and reporting for cloud backups
■ Viewing cloud storage job details
■ Viewing NetBackup cloud storage disk reports
■ Displaying KMS key information for cloud storage encryption

About monitoring and reporting for cloud backups

Veritas provides several methods to monitor and report NetBackup cloud storage and cloud storage activity, as follows:

NetBackup OpsCenter

The NetBackup OpsCenter provides the most detailed reports of NetBackup cloud storage activity. See the NetBackup OpsCenter Administrator’s Guide for details on cloud monitoring and reporting:

http://www.veritas.com/docs/DOC5332

If OpsCenter cannot connect to the CloudStore Service Container, it cannot obtain the necessary data for reporting. Therefore, ensure that the CloudStore Service Container is active on the NetBackup media servers that you use for cloud storage.

See “Connection to the NetBackup CloudStore Service Container fails” on page 129.
The Disk Pools window displays the values that were stored when NetBackup polled the disk pools. NetBackup polls the disk pools every five minutes.

To display the window, in the NetBackup Administration Console, in the left pane, select Media and Device Management > Devices > Disk Pools.

**Note:** The information that is displayed for Used Capacity and Available Space is inaccurate in the NetBackup Administration Console. Even if there is data in the disk pool, the value that is displayed for Used Capacity is zero. The value for Available Space displays the maximum amount. You must review the information on the provider website for accurate use information.

NetBackup disk reports See “Viewing NetBackup cloud storage disk reports” on page 113.

**Viewing cloud storage job details**

Use the NetBackup Activity Monitor to view job details.

**To view cloud storage job details**

1. In the NetBackup Administration Console, click Activity Monitor.
2. Click the Jobs tab.
3. To view the details for a specific job, double-click on the job that is displayed in the Jobs tab pane.
4. In the Job Details dialog box, click the Detailed Status tab.

**Viewing NetBackup cloud storage disk reports**

The NetBackup disk reports include information about the disk pools, disk storage units, disk logs, and images that are stored on disk media.

**Table 4-1** describes the disk reports available.
### Table 4-1: Disk reports

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Images on Disk</td>
<td>The Images on Disk report generates the image list present on the disk storage units that are connected to the media server. The report is a subset of the Images on Media report; it shows only disk-specific columns. The report provides a summary of the storage unit contents. If a disk becomes bad or if a media server crashes, this report can let you know what data is lost.</td>
</tr>
<tr>
<td>Disk Logs</td>
<td>The Disk Logs report displays the media errors or the informational messages that are recorded in the NetBackup error catalog. The report is a subset of the Media Logs report; it shows only disk-specific columns.</td>
</tr>
<tr>
<td>Disk Storage Unit Status</td>
<td>The Disk Storage Unit Status report displays the state of disk storage units in the current NetBackup configuration. Multiple storage units can point to the same disk pool. When the report query is by storage unit, the report counts the capacity of disk pool storage multiple times.</td>
</tr>
<tr>
<td>Disk Pool Status</td>
<td>The Disk Pool Status report displays the state of disk pool storage units. This report displays only when a Data Protection Optimization Option license is installed.</td>
</tr>
</tbody>
</table>

See “About monitoring and reporting for cloud backups” on page 112.

### To view disk reports

1. In the NetBackup Administration Console, in the left pane, expand NetBackup Management > Reports > Disk Reports.
2. Select the name of a disk report.
3. In the right pane, select the report settings.

### Displaying KMS key information for cloud storage encryption

You can use the `nbkmsutil` command to list the following information about the key groups and the key records:

| Key groups        | See To display KMS key group information. |
Keys  See To display KMS key information.

---

**Note:** Veritas recommends that you keep a record key information. The key tag that is listed in the output is necessary if you need to recover keys.

---

### To display KMS key group information

- To list all of the key groups, use the `nbkmsutil` with the `-listkgs` option. The following is the command format:
  
  **UNIX:** `/usr/openv/netbackup/bin/admincmd/nbkmsutil -listkgs`
  
  **Windows:** `install_path\Veritas\NetBackup\bin\admincmd\nbkmsutil -listkgs`

The following is example output on UNIX hosted storage. On Windows, the volume name is not used.

```
 nbkmsutil -listkgs

Key Group Name : CloudStorageVendor.com:symc_volume_for_backups
Supported Cypher : AES_256
Number of Keys : 1
Has Active Key : Yes
Creation Time : Tues Jan 01 01:00:00 2013
Last Modification Time: Tues Jan 01 01:00:00 2013
Description : -
```
To display KMS key information

To list all of the keys that belong to a key group name, use the `nbkmsutil` with the `-listkgs` and `-kgname` options. The following is the command format:

Windows: `install_path\Veritas\NetBackup\bin\admincmd\nbkmsutil-listkeys -kgname AdvDiskServer1.example.com:`

The following is example output on UNIX hosted storage. On Windows, the volume name is not used.

```
nbkmsutil -listkeys -kgname CloudStorageVendor.com:symc_volume_for_backup

Key Group Name : CloudStorageVendor.com:symc_volume_for_backups
Supported Cypher : AES_256
Number of Keys : 1
Has Active Key : Yes
Creation Time : Tues Jan 01 01:00:00 2013
Last Modification Time: Tues Jan 01 01:00:00 2013
Description : -

Key Tag : 532cf41cc8b3513a13c1c26b5128731e5ca0b9b01e0689cc38ac2b7596bbae3c
Key Name : Encrypt_Key_April
Current State : Active
Creation Time : Tues Jan 01 01:02:00 2013
Last Modification Time: Tues Jan 01 01:02:00 2013
Description : -
```
Operational notes

This chapter includes the following topics:

- NetBackup bpstsinfo command operational notes
- Unable to configure additional media servers
- Cloud configuration may fail if NetBackup Access Control is enabled
- Deleting cloud storage server artifacts

NetBackup bpstsinfo command operational notes

The following table describes operational notes for the `bpstsinfo` command with NetBackup cloud storage.

<table>
<thead>
<tr>
<th>Note</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use either the <code>-stype</code> option or the <code>-storageserverprefix</code></td>
<td>Use either the <code>-stype</code> option or the <code>-storageserverprefix</code> option to constrain the <code>bpstsinfo</code> command to list storage server information. If you do not, the command searches all providers, which may be time consuming and may result in a timeout.</td>
</tr>
<tr>
<td>Specify the correct <code>-stype</code></td>
<td>The plug-in that requests the information affects the information that is returned. Therefore, use the correct <code>-stype</code> with the <code>bpstsinfo</code> command. To determine the <code>-stype</code>, use the following command: <code>nbdevquery -liststs -storage_server fq_host_name</code>&lt;br&gt;If the storage is encrypted, the <code>-stype</code> includes an <code>_crypt</code> suffix.</td>
</tr>
</tbody>
</table>
Table 5-1  bpstsinfo command operational notes (continued)

<table>
<thead>
<tr>
<th>Note</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encrypted and non-encrypted storage units are displayed in bpstsinfo command output.</td>
<td>When you use the bpstsinfo command to display the encrypted logical storage unit (LSU) information, the output shows both encrypted and non-encrypted LSUs if both types exist. That output is the expected result. The bpstsinfo command operates on the level of the storage plug-in, which is not aware of any higher-level detail, such as encryption. The following is an example of a command that specifies encrypted storage: bpstsinfo -lsuinfo -storage_server amazon.com -stype amazon_crypt.</td>
</tr>
</tbody>
</table>

Unable to configure additional media servers

If you attempt to run the Cloud Storage Server Configuration Wizard on a second media server that uses the same master server as the first media server, the operation fails. An illegal duplication error similar to the following appears:

Your only options in the wizard are to click Cancel or Back. If you click Back, there are no configuration changes that allow the wizard to continue.

You must use the correct procedure if you want multiple media servers in your cloud environment. More information is available in a different topic.

See “Adding backup media servers to your cloud environment” on page 98.

Cloud configuration may fail if NetBackup Access Control is enabled

If you attempt to configure a cloud storage server in an environment that uses NetBackup Access Control, you may receive an error message similar to the following:

Error creating Key Group and Keys cannot connect on socket
NetBackup generates this error message because the user does not have sufficient rights within NetBackup Access Control. The user account that configures the cloud storage server must be a member of the NBU_KMS Admin Group.

See the *NetBackup Security and Encryption Guide* for more information about NetBackup Access Control and account setup:

http://www.veritas.com/docs/DOC5332

## Deleting cloud storage server artifacts

If you incorrectly remove a storage server, configuration files are left orphaned on the computer. Attempts to create a new storage server fail with an error message that indicates a logon failure. Use the following procedure to correctly delete a storage server:

**Deleting a storage server**

1. Expire all images on the storage server.
2. Delete the storage unit.
3. Delete the disk pool.
4. Delete the storage server.
5. Delete .pref files from db/cloud directory.
Troubleshooting

This chapter includes the following topics:

- About unified logging
- About legacy logging
- NetBackup cloud storage log files
- Enable libcurl logging
- NetBackup Administration Console fails to open
- Troubleshooting cloud storage configuration issues
- Troubleshooting cloud storage operational issues

About unified logging

Unified logging and legacy logging are the two forms of debug logging used in NetBackup. Unified logging creates log file names and messages in a standardized format. All NetBackup processes use either unified logging or legacy logging.

Unlike the files that are written in legacy logging, unified logging files cannot be easily viewed with a text editor. The unified logging files are in binary format, and some of the information is contained in an associated resource file. Only the vxlogview command can assemble and display the log information correctly.

See “About legacy logging” on page 123.

Server processes and client processes use unified logging.

Unlike legacy logging, unified logging does not require that you create logging subdirectories. Log files for originator IDs are written to a subdirectory with the name specified in the log configuration file. All unified logs are written to subdirectories in the following directory:
You can access logging controls in the **NetBackup Administration Console**. In the left pane, expand **NetBackup Management > Host Properties > Master Servers** or **Media Servers**. Double-click the server you want to change. In the left pane of the dialog box, click **Logging**.

You can also manage unified logging by using the following commands:

- **vxlogcfg**: Modifies the unified logging configuration settings. For more information about the `vxlogcfg` command.

- **vxlogmgr**: Manages the log files that the products that support unified logging generate. For more information about the `vxlogmgr` command.

- **vxlogview**: Displays the logs that unified logging generates. See “Examples of using `vxlogview` to view unified logs” on page 122 for more information about the `vxlogview` command.

See the *NetBackup Commands Reference Guide* for a complete description about these commands. The guide is available through the following URL: [http://www.veritas.com/docs/DOC5332](http://www.veritas.com/docs/DOC5332).

These commands are located in the following directory:

- **Windows**: `install_path\NetBackup\bin`
- **UNIX**: `/usr/openv/netbackup/bin`

### About using the `vxlogview` command to view unified logs

Use the **vxlogview** command to view the logs that unified logging creates. These logs are stored in the following directory.

- **UNIX**: `/usr/openv/logs`
- **Windows**: `install_path\NetBackup\logs`

Unlike the files that are written in legacy logging, unified logging files cannot be easily viewed with a text editor. The unified logging files are in binary format, and
some of the information is contained in an associated resource file. Only the
vxlogview command can assemble and display the log information correctly.

You can use vxlogview to view NetBackup log files as well as PBX log files.

To view PBX logs using the vxlogview command, do the following:

- Ensure that you are an authorized user. For UNIX and Linux, you must have
  root privileges. For Windows, you must have administrator privileges.
- To specify the PBX product ID, enter -p 50936 as a parameter on the vxlogview
  command line.

vxlogview searches all the files, which can be a slow process. Refer to the following
topic for an example of how to display results faster by restricting the search to the
files of a specific process.

Examples of using vxlogview to view unified logs

The following examples demonstrate how to use the vxlogview command to view
unified logs.

<table>
<thead>
<tr>
<th>Item</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display all the attributes of the log</td>
<td>vxlogview -p 51216 -d all</td>
</tr>
<tr>
<td>messages</td>
<td></td>
</tr>
<tr>
<td>Display specific attributes of the log</td>
<td>Display the log messages for NetBackup (51216) that show only the date, time, message type, and message text: vxlogview --prodid 51216 --display D,T,m,x</td>
</tr>
<tr>
<td>messages</td>
<td>Display the latest log messages</td>
</tr>
<tr>
<td>Display the latest log messages</td>
<td>Display the log messages for originator 116 (nbpem) that were issued during the last 20 minutes. Note that you can specify -o nbpem instead of -o 116: # vxlogview -o nbpem -t 00:20:00</td>
</tr>
<tr>
<td>Display the log messages from a specific</td>
<td>Display the log messages for nbpem that were issued during the specified time period:</td>
</tr>
<tr>
<td>time period</td>
<td># vxlogview -o nbpem -b &quot;05/03/15 06:51:48 AM&quot; -e &quot;05/03/15 06:52:48 AM&quot;</td>
</tr>
</tbody>
</table>
### Example uses of the vxlogview command (continued)

<table>
<thead>
<tr>
<th>Item</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display results faster</td>
<td>You can use the <code>-i</code> option to specify an originator for a process:</td>
</tr>
<tr>
<td></td>
<td># vxlogview -i nbpem</td>
</tr>
<tr>
<td></td>
<td>The <code>vxlogview -i</code> option searches only the log files that the specified process (nbpem) creates. By limiting the log files that it has to search, <code>vxlogview</code> returns a result faster. By comparison, the <code>vxlogview -o</code> option searches all unified log files for the messages that the specified process has logged.</td>
</tr>
<tr>
<td>Note:</td>
<td>If you use the <code>-i</code> option with a process that is not a service, <code>vxlogview</code> returns the message &quot;No log files found.&quot; A process that is not a service has no originator ID in the file name. In this case, use the <code>-o</code> option instead of the <code>-i</code> option.</td>
</tr>
<tr>
<td></td>
<td>The <code>-i</code> option displays entries for all OIDs that are part of that process including libraries (137, 156, 309, etc.).</td>
</tr>
<tr>
<td>Search for a job ID</td>
<td>You can search the logs for a particular job ID:</td>
</tr>
<tr>
<td></td>
<td># vxlogview -i nbpem</td>
</tr>
<tr>
<td></td>
<td>The <code>jobid=</code> search key should contain no spaces and must be lowercase.</td>
</tr>
<tr>
<td></td>
<td>When searching for a job ID, you can use any <code>vxlogview</code> command option. This example uses the <code>-i</code> option with the name of the process (nbpem). The command returns only the log entries that contain the job ID. It misses related entries for the job that do not explicitly contain the <code>jobid=job_ID</code>.</td>
</tr>
</tbody>
</table>

See the [NetBackup Commands Reference Guide](http://www.veritas.com/docs/DOC5332) for a complete description of the `vxlogview` command. The guide is available through the following URL:

http://www.veritas.com/docs/DOC5332

### About legacy logging

Legacy logging and unified logging are the two forms of debug logging used in NetBackup. All NetBackup processes use either unified logging or legacy logging.

See “About unified logging” on page 120.
In legacy debug logging, each process creates log files of debug activity in its own logging directory. The NetBackup legacy debug log directories are located in the following directories:

**Windows**
- `install_path\NetBackup\logs`
- `install_path\Volmgr\debug`

**UNIX**
- `/usr/openv/netbackup/logs`
- `/usr/openv/volmgr/debug`

These top-level directories can contain a directory for each NetBackup process that uses legacy logging. By default, NetBackup creates only a subset of all of the possible log directories (the bpbrm, bpcd, bpdm, and bptm directories). To enable logging for all NetBackup processes that use legacy logging, you must create the log file directories that do not already exist, unless you use the Logging Assistant. See more information about the Logging Assistant in the *NetBackup Administrator's Guide, Volume I*. The guide is available at the following location:

http://www.veritas.com/docs/DOC5332

You can use the following batch files to create all of the debug log directories at once:

- **Windows**: `install_path\NetBackup\Logs\mklogdir.bat`
- **UNIX**: `/usr/openv/netbackup/logs/mklogdir`

See the *NetBackup Commands Reference Guide* for a complete description about the `mklogdir` command. The guide is available at the following location:

http://www.veritas.com/docs/DOC5332

After the directories are created, NetBackup creates log files in the directory that is associated with each process. A debug log file is created when the process begins. Each log file grows to a certain size before the NetBackup process closes it and creates a new log file.

To enable debug logging for the NetBackup Status Collection Daemon (**vmscd**), create the following directory before you start `nbemm`.

**Windows**
- `install_path\Volmgr\debug\vmscd`  

**UNIX**
- `/usr/openv/volmgr/debug/vmscd`

As an alternative, you can restart **vmscd** after creating the directory.
Creating NetBackup log file directories for cloud storage

Before you configure your NetBackup feature, create the directories into which the NetBackup commands write log files. Create the directories on the master server and on each media server that you use for your feature. The log files reside in the following directories:

- **UNIX**: /usr/openv/netbackup/logs/
- **Windows**: install_path\NetBackup\logs\n
More information about NetBackup logging is available in the *NetBackup Logging Reference Guide*, available through the following URL:

http://www.veritas.com/docs/DOC5332

**To create log directories for NetBackup commands**

- Depending on the operating system, run one of the following scripts:
  - UNIX: /usr/openv/netbackup/logs/mklogdir
  - Windows: install_path\NetBackup\logs\mklogdir.bat

**To create the tpconfig command log directory**

- Depending on the operating system, create the debug directory and the tpcommand directory (by default, the debug directory and the tpcommand directory do not exist). The pathnames of the directories are as follows:
  - UNIX: /usr/openv/volmgr/debug/tpcommand
  - Windows: install_path\Veritas\Volmgr\debug\tpcommand

### NetBackup cloud storage log files

NetBackup cloud storage exists within the Veritas OpenStorage framework. Therefore, the log files for cloud activity are the same as for OpenStorage with several additions.

Some NetBackup commands or processes write messages to their own log files. For those commands and processes, the log directories must exist so that the utility can write log messages.

Other processes use Veritas unified log (VxUL) files. Each process has a corresponding VxUL originator ID. VxUL uses a standardized name and file format for log files. To view VxUL log files, you must use the NetBackup vxlogview command.

More information about how to view and manage VxUL log files is available. See the *NetBackup Logging Reference Guide*:
http://www.veritas.com/docs/DOC5332

The following are the component identifiers for log messages:

- An `sts_` prefix relates to the interaction with the plug-in that writes to and reads from the storage.
- A cloud storage server prefix relates to interaction with that cloud vendor’s storage network.
- An `encrypt` prefix relates to interaction with the encryption plug-in.
- A `KMSCLIB` prefix relates to interaction with the NetBackup Key Management Service.

Most interaction occurs on the NetBackup media servers. Therefore, the log files on the media servers that you use for disk operations are of most interest.

---

**Warning:** The higher the log level, the greater the affect on NetBackup performance. Use a log level of 5 (the highest) only when directed to do so by a Veritas representative. A log level of 5 is for troubleshooting only.

Specify the NetBackup log levels in the Logging host properties on the NetBackup master server. The log levels for some processes specific to certain options are set in configuration files as described in Table 6-2.

---

**Table 6-2** describes the logs.

**Table 6-2**

| Device configuration                    | 202 | The Storage Server Interface process that runs in the Remote Manager and Monitor Service. RMMS runs on media servers.                      |
| Device configuration                    | 230 | The Remote Disk Service Manager interface (RDSM) that runs in the Remote Manager and Monitor Service. RMMS runs on media servers.       |

See “Troubleshooting cloud storage operational issues” on page 132.

## Enable libcurl logging

Set the storage server property `CLOUD_PREFIX:LOG_CURL` to `YES` to enable cURL logging. The `CLOUD_PREFIX` value is the prefix value of each storage provider. The possible values are:

- AMZ for Amazon
- AMZGOV for Amazon GovCloud
To example, to enable LOG_CURL for AT&T set ATT:LOG_CURL to YES.

See “Changing cloud storage server properties” on page 74.

NetBackup Administration Console fails to open

If you change the default port of the NetBackup CloudStore Service Container, the NetBackup Administration Console may not open. You must change the value in two places.

The CloudStore Service Container configuration file resides in the following directories:

- UNIX: /usr/openv/java/cloudstorejava.conf
- Windows: install_path\Veritas\NetBackup\bin\cloudstorewin.conf

The following is an example that shows the default value:

```
[NBCSSC]
NBCSSC_PORT=5637
```

The services file is in the following locations:

- Windows: C:\WINDOWS\system32\drivers\etc\services
- Linux: /etc/services

If you change the value in the CloudStore Service Container configuration file also change the value in the services file.

By default, the NetBackup CloudStore Server Container port is 5637.

See “Connection to the NetBackup CloudStore Service Container fails” on page 129.
Troubleshooting cloud storage configuration issues

The following sections may help you troubleshoot configuration issues.
See “NetBackup Scalable Storage host properties unavailable” on page 129.
See “Connection to the NetBackup CloudStore Service Container fails” on page 129.
See “Cannot create a cloud storage disk pool” on page 130.
See “NetBackup Administration Console fails to open” on page 128.
See “Data restore from the Google Nearline storage class may fail” on page 131.

NetBackup Scalable Storage host properties unavailable

If the NetBackup CloudStore Service Container is not active, the Scalable Storage host properties are unavailable. Either of the following two symptoms may occur:

■ The Scalable Storage properties for a media server are unavailable
■ A pop-up box may appear that displays an “Unable to fetch Scalable Storage settings” message.

You should determine why the NetBackup CloudStore Service Container is inactive, resolve the problem, and then start the Service Container.

See “NetBackup CloudStore Service Container startup and shutdown troubleshooting” on page 136.
See “Stopping and starting the NetBackup CloudStore Service Container” on page 135.

Connection to the NetBackup CloudStore Service Container fails

The NetBackup cloud storage csconfig configuration command makes three attempts to connect to the NetBackup CloudStore Service Container with a 60-second timeout for each connection attempt. The NetBackup OpsCenter also connects to the CloudStore Service Container to obtain data for reporting.

If they cannot establish a connection, verify the following information:

■ That the NetBackup CloudStore Service Container is active.
  See “NetBackup CloudStore Service Container startup and shutdown troubleshooting” on page 136.
■ Your firewall settings are appropriate.
Cannot create a cloud storage disk pool

The following table describes potential solutions if you cannot create a disk pool in NetBackup.

Table 6-3 Cannot create disk pool solutions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The wizard is not able to obtain Storage Server information. Cannot connect on socket. (25)</td>
<td>The error message appears in the Disk Configuration Wizard. The Disk Configuration Wizard query to the cloud vendor host timed-out. The network may be slow or a large number of objects (for example, buckets on Amazon S3) may exist. To resolve the issue, use the NetBackup nbdevconfig command to configure the disk pool. Unlike the wizard, the nbdevconfig command does not monitor the command response times. See the NetBackup Commands Reference Guide for a complete description of the commands. The guide is available at the following location: <a href="http://www.veritas.com/docs/DOC5332">http://www.veritas.com/docs/DOC5332</a></td>
</tr>
</tbody>
</table>

Data transfer to cloud storage server fails in the SSL mode

NetBackup supports only Certificate Authority (CA)-signed certificates while it communicates with cloud storage in the SSL mode. Ensure that the cloud server (public or private) has CA-signed certificate. If it does not have the CA-signed certificate, data transfer between NetBackup and cloud provider fails in the SSL mode.

Amazon GovCloud cloud storage configuration fails in non-SSL mode

The FIPS region of Amazon GovCloud cloud provider (that is s3-fips-us-gov-west-1.amazonaws.com) supports only secured mode of communication. Therefore, if you disable the Use SSL option while you configure Amazon GovCloud cloud storage with the FIPS region, the configuration fails.

To enable the SSL mode again, run the csconfig command with -us parameter to set the value of SSL to '2'.

See the NetBackup Commands Reference Guide for a complete description about the commands. The guide is available at the following location:
Data restore from the Google Nearline storage class may fail

Data restore from the Google Nearline storage class may fail, if your READ_BUFFER_SIZE in NetBackup is set to a value that is greater than the allotted read throughput. Google allots the read throughput based on the total size of the data that you have stored in the Google Nearline storage class.

Note: The default READ_BUFFER_SIZE is 100 MB.

The NetBackup bptm logs show the following error after the data restore from Google Nearline fails:

HTTP status: 429, Retry type: RETRY_EXHAUSTED

Google provides 4 MB/s of read throughput per TB of data that you store in the Google Nearline storage class per location. You should change the READ_BUFFER_SIZE value in NetBackup to match it to the read throughput that Google allots.

For example, if the data that you have stored in the Google Nearline storage class is 5 TB, you should change the READ_BUFFER_SIZE value to match it to the allotted read throughput, which equals to 20 MB.

Refer to the Google guidelines, for more information:
https://cloud.google.com/storage/docs/nearline?hl=en

See “Changing cloud storage server properties” on page 74.

See “NetBackup storage server cloud connection properties” on page 76.

Backups may fail for cloud storage configurations with Frankfurt region

NetBackup 7.7.1 and later versions support configuring cloud storage using the Frankfurt region. NetBackup media servers that are older than the 7.7.1 version do not support configuring cloud storage using the Frankfurt region.

Cloud backups may fail in the following scenario:

You have configured cloud storage server with a media server that is older than NetBackup 7.7.1. You have created a disk pool in the Frankfurt region using an existing bucket.
To avoid such cloud backup failures, ensure that when you configure cloud storage using the Frankfurt region, the cloud media server is NetBackup 7.7.1 or later version.

Backups may fail for cloud storage configurations with the cloud compression option

The NetBackup cloud data compression option requires all cloud media servers that are associated with the cloud storage configuration to be NetBackup 7.7.3 or later version.

Cloud backups may fail in the following cloud compression scenario:

You have configured cloud storage server using the NetBackup Administration Console or the command-line interface with the compression option enabled, with a media server that is compatible. You then add a media server of a version that is older than NetBackup 7.7.3 using the command-line interface, to the same cloud configuration.

To avoid such cloud backup failures, ensure that all media servers that you add to the cloud storage configuration with the compression option to be NetBackup 7.7.3 or later version.

Troubleshooting cloud storage operational issues

The following sections may help you troubleshoot operational issues.

See “NetBackup Scalable Storage host properties unavailable” on page 129.

See “Cloud storage backups fail” on page 132.

See “A restart of the nbcssc process reverts all cloudstore.conf settings” on page 135.

See “NetBackup CloudStore Service Container startup and shutdown troubleshooting” on page 136.

See “NetBackup Administration Console fails to open” on page 128.

Cloud storage backups fail

See the following topics:

- Accelerator backups fail
- Backups fail after the WRITE_BUFFER_SIZE is increased
- The storage volume was created by the cloud vendor interface
- AIX media server backs up large files
The NetBackup CloudStore Service Container is not active

Backups may fail if the Use any available media server option is selected

Accelerator backups fail
A message similar to the following is in the job details:

Critical bptm(pid=28291) accelerator verification failed: backupid=host_name_1373526632, offset=3584, length=141976576, error=2060022, error message: software error

Critical bptm(pid=28291) image write failed: error 2060022: software error

Error bptm(pid=28291) cannot write image to disk, Invalid argument end writing; write time: 0:02:31

Info bptm(pid=28291) EXITING with status 84

Info bpbkar(pid=6044) done. status: 84: media write error media write error(84)

This error may occur in the environments that have more than one cloud storage server. It indicates that NetBackup Accelerator backups of a client to one cloud storage server were later directed to a different cloud storage server.

For Accelerator backups to cloud storage, ensure the following:

- Always back up each client to the same storage server. Do so even if the other storage server represents storage from the same cloud storage vendor.
- Always use the same backup policy to back up a client, and do not change the storage destination of that policy.

Backups fail after the WRITE_BUFFER_SIZE is increased
If the cloud storage server WRITE_BUFFER_SIZE property exceeds the total swap space of the computer, backups can fail with a status 84.

Adjust the WRITE_BUFFER_SIZE size to a value lower than the computer’s total swap space to resolve this issue.

The storage volume was created by the cloud vendor interface
A message similar to the following is in the job details:

Info bptm(pid=xxx) start backup

Critical bptm(pid=xxxx) image open failed: error 2060029: authorization failure

Error bpbrm(pid=xxxx) from client gabby: ERR - Cannot write to STDOUT. E
rrno = 32: Broken pipe
Info bptm(pid=xxxx) EXITING with status 84

A message similar to the following appears in the bptm log file:

Container container_name is not Veritas container or tag data error, fail to create image. Please make sure that the LSU is created by means of NBU.

This error indicates that the volume was created by using the cloud storage vendor’s interface.

You must use the NetBackup Disk Pool Configuration Wizard to create the volume on the cloud storage. The wizard applies a required partner ID to the volume. If you use the vendor interface to create the container, the partner ID is not applied.

To resolve the problem, use the cloud storage vendor’s interface to delete the container. In NetBackup, delete the disk pool and then recreate it by using the Disk Pool Configuration Wizard.

See “Viewing cloud storage job details” on page 113.
See “NetBackup cloud storage log files” on page 125.

AIX media server backs up large files
When an AIX media server backs up large files, you may encounter memory issues. These memory issues can result in failed backups. The backups fail with a NetBackup status code 84 (media write error) or a NetBackup status code 87 (media close error). Change the AIX ulimit size to unlimited to resolve this issue. Be sure to stop and restart the NetBackup services or daemons after you change the ulimit value.

The following are examples:

ulimit -m unlimited
ulimit -d unlimited
ulimit -s unlimited

The NetBackup CloudStore Service Container is not active
If the NetBackup CloudStore Service Container is not active, backups cannot be sent to the cloud storage.

NetBackup does not validate that the CloudStore Service Container is active when you use NetBackup commands to configure NetBackup cloud storage. Therefore, any backups that initiate in such a scenario fail.

See “NetBackup CloudStore Service Container startup and shutdown troubleshooting” on page 136.
Backups may fail if the Use any available media server option is selected

While you configure a cloud storage server, you must ensure that the media server and the master server are of the same version.

**Note:** This limitation does not apply to the existing cloud storage servers.

Cloud backups may fail in the following scenario:

You selected **Use any available media server** while you configured the storage unit and NetBackup uses a media server with version different than the master server version during cloud storage configuration.

To resolve this issue, do the following:

Select **Only use the following media servers** while you configure the storage unit and select the media server with a version same as master server from the **Media Servers** pane.

**Stopping and starting the NetBackup CloudStore Service Container**

Use the **NetBackup Administration Console** to stop and start the NetBackup CloudStore Service Container (nbcssc) service.

See “About the NetBackup CloudStore Service Container” on page 35.

See “NetBackup CloudStore Service Container startup and shutdown troubleshooting” on page 136.

**To start or stop the CloudStore Service Container**

1. In the **NetBackup Administration Console**, expand **NetBackup Administration > Activity Monitor**.
2. Click the **Daemons** tab (UNIX) or the **Services** tab (Windows).
3. In the **Details** pane, select **nbcssc** (UNIX and Linux) or **NetBackup CloudStore Service Container** (Windows).
4. On the **Actions** menu, select **Stop Selected** or **Start Selected** (Windows) or **Stop Daemon** or **Start Daemon** (UNIX).

A restart of the nbcssc process reverts all cloudstore.conf settings

Missing entries and comments are not allowed in the cloudstore.conf file. If you remove or comment out values in the cloudstore.conf file, a restart of the nbcssc process returns all settings to their default values.
NetBackup CloudStore Service Container startup and shutdown troubleshooting

See the following topics:
- Security certificate not provisioned
- Security mode changed while service is active

**Security certificate not provisioned**

The NetBackup media servers that you use for cloud storage must have a security certificate provisioned. If not, the CloudStore Service Container cannot start. Verify that the certificate exists.

See “NetBackup CloudStore Service Container security certificates” on page 36.

NetBackup 7.7 and later If a certificate does not exist, create one from the NetBackup master server.

See “Deploying a security certificate on a NetBackup host” on page 40.

NetBackup releases earlier than 7.7 If the certificate becomes corrupt or expires, delete the old certificate and restart the services to regenerate a new certificate.

**Security mode changed while service is active**

Do not change the security mode of the NetBackup CloudStore Service Container while the service is active. If the security mode is changed while the service is active, you may encounter service startup or service shutdown problems. Be sure to stop the service in the same mode it was started.

See “NetBackup CloudStore Service Container security modes” on page 37.

See “Stopping and starting the NetBackup CloudStore Service Container” on page 135.
